Chapter 73: PRUDENCE

INTRODUCTION

OF the qualities or virtues attributed to the intellect, prudence seems to be least concerned with knowledge and most concerned with action. When we call a man a scientist or an artist, or praise the clarity of his understanding, we imply only that he has a certain kind of knowledge. We admire his mind, but we do not necessarily admire him as a man. We may not even know what kind of man he is or what kind of life he leads. It is significant that our language does not contain a noun like "scientist" or "artist" to describe the man who possesses prudence. We must use the adjective and speak of a prudent man, which seems to suggest that prudence belongs to the whole man, rather than just to his mind.

Prudence seems to be almost as much a moral as an intellectual quality. We would hardly call a man prudent without knowing his manner of life. Whether he behaved temperately would probably be much more relevant to our judgment of his prudence than whether he had a cultivated mind. The extent of his education or the depth of his learning might not affect our judgment at all, but we probably would consider whether he was old enough to have learned anything from experience and whether he had actually profited from experience to become wise.

These observations not only express the ordinary sense of the word "prudence," but also give a summary indication of the idea for which that word stands in the great books. Like other fundamental traits of mind or character, prudence is considered by the poets and historians in terms of precept and example. For the definition of the term or for an analysis of its relation to other fundamental ideas, such as virtue and happiness, desire and duty, one must go to the great works of moral and political theory or of theology.

Even there, however, the conception of prudence is used more frequently than it is expounded. Plato, Aristotle, Aquinas, Hobbes, and Kant seem to be the exceptions, and of these only Aristotle and Aquinas offer an extended analysis—Aristotle in his book on intellectual virtue in the *Ethics*, Aquinas in certain questions of his *Treatise on Habits* in the *Summa Theologica*, but more extensively in his *Treatise on Prudence* (see the questions from the *Summa Theologica* cited in the list of Additional Readings).

THAT PRUDENCE IS NOT knowledge in the ordinary sense of the term—that it is a product of experience and a possession of reason which, unlike science or art, cannot be expressed in propositions—seems to be clearly implied by Hobbes. "When the thoughts of a man, that has a design in hand, running over a multitude of things, observes how they conduce to that design, or what design they may conduce to; if his observations are such as are not easy or usual; this wit of his is called Prudence, and depends on much experience and memory of the like things, and their consequences heretofore."

Whereas science can achieve some certainty, the judgments of prudence are, according to Hobbes, all uncertain, "because to observe by experience and remember all circumstances that may alter the success, is impossible." It is the opposition between experience and science which seems to lead Hobbes to distinguish prudence from wisdom. "As much experience is prudence, so is much science sapience. For though we usually have one name of wisdom for them both, yet the Latins did always distinguish between *prudentia* and *sapientia*, ascribing the former to experience, the latter to science."

The Greeks also had two words—*phronesis*

and *sophia*—both of which are sometimes translated in English by “wisdom.” But Aristotle, like Hobbes, insists upon the distinction between the wisdom which is the ultimate fruit of the speculative sciences or philosophy and the wisdom which belongs to the sphere of moral and political action. Wishing to preserve Aristotle’s sense that *phronesis* and *sophia* have something in common which deserves the eulogistic connotation of “wisdom,” his translators usually render these words in English by the phrases “practical wisdom” or “political wisdom” (for *phronesis*), and “speculative wisdom” or “philosophical wisdom” (for *sophia*). The English rendering of Aquinas, on the other hand, usually translates his *prudentia* by “prudence,” and his *sapientia* by “wisdom.”

Whether it is permissible to use “prudence” and “practical wisdom” as synonyms may be more than a question of verbal equivalence; for there is a fundamental issue in theory concerning the unity of wisdom, on which Plato differs from both Aristotle and Aquinas. The question about the relation of knowledge and virtue may be differently answered according to the view of wisdom which denies its division into speculative and practical, and according to the view which conceives the possibility that a man may be wise in one way without being wise in the other. In the language of Aquinas, a man may have acquired wisdom through science and understanding without having the moral character of a prudent man.

“That practical wisdom is not scientific knowledge is evident,” Aristotle declares. This is confirmed, he adds, “by the fact that while young men become geometers and mathematicians and wise in matters like these, it is thought that a young man of practical wisdom cannot be found. The reason is that such wisdom is concerned not only with universals but with particulars, which become familiar from experience, but a young man has no experience, for it is length of time that gives experience.”

Hobbes and Aristotle seem to agree that experience is important for the development of prudence or practical wisdom precisely because “it is practical and practice is concerned with particulars.” But though both also agree that this explains the distinction between prudence and scientific knowledge—which is con-

cerned not with action but with the nature of things—Aristotle alone raises a further question about the distinction between practical wisdom and art.

In making something, the artist also deals with particulars. In this sense, art is also practical. But, according to Aristotle, the word “productive” should be used in distinction from “practical” to signify the difference between making and doing—two kinds of human activity which, though alike as compared with scientific knowing, represent knowledge differently applied. The knowledge which the artist possesses can, furthermore, be formulated in a set of rules. An individual can acquire the skill of an art by practicing according to its rules. What a man knows when he is prudent seems to be much less capable of being communicated by precept or rule. What he knows is how to deliberate or calculate well about things to be done.

This, in Aristotle’s view, marks prudence off from all other virtues. That prudence is a quality of mind seems to follow from the fact that it involves deliberation, a kind of thinking about variable and contingent particulars of the same sort which belong to the realm of opinion. That prudence is also a moral quality, an aspect of character, seems to follow no less from Aristotle’s statement that prudence is not deliberation about the means to any sort of end, but only about those “which conduce to the good life in general.”

PRUDENCE IS NOT ALWAYS described as skill of mind in deliberating about alternative courses of action, nor is it always regarded as entirely praiseworthy or admirable—inseparable from virtue and the good life.

It is, for example, sometimes identified with foresight or even conjecturing about the future. So conceived, prudence does not seem to require rational power so much as memory and imagination, in order to project past experience into the future. In this sense, Aristotle admits it may be said that “even some of the lower animals have practical wisdom, *viz.*, those which are found to have a power of foresight with regard to their own life.”

Identifying prudence with foresight, Hobbes conceives perfect prudence as belonging only

to God. When the event answers expectations, the prediction is attributed to prudence, yet human foresight being fallible, "it is but presumption. For the foresight of things to come, which is Providence, belongs only to him by whose will they are to come." Aquinas gives a quite different reason for saying that "prudence or providence may suitably be attributed to God." It is that the ordering of things toward their ultimate end is "the chief part of prudence, to which two other parts are directed—namely, remembrance of the past, and understanding of the present; inasmuch from the remembrance of what is past and the understanding of what is present, we gather how to provide for the future."

Prudence is sometimes described, not as a virtue of the mind, or even as the power of foresight, but as a temperamental trait, an emotional disposition. It is associated with timidity or caution in those who are fearful of risks or unwilling to take chances. It is in this sense that Bacon seems to oppose hopefulness to prudence, "which is diffident upon principle and in all human matters augurs the worst." The cautiousness of the over-deliberate man may involve thought as well as fear. Hamlet thinks too much and on too many sides of every action. His action being "sicklied o'er by the pale cast of thought," he is irresolute. He laments his misuse of reason. "Whether it be bestial oblivion, or some craven scruple of thinking too precisely on the event—a thought, which quartered, hath but one part wisdom and ever three parts coward—I do not know why yet I live to say 'this thing's to do,' since I have cause, and will, and strength, and means to do it."

When prudence is conceived as excessive caution, its opposite is usually described as rashness, precipitateness, or impetuosity. Thucydides portrays these opposites in the persons of Nicias and Alcibiades. Their speeches to the Athenian assembly on the question of the Sicilian expedition do not merely present an opposition of reasons for and against the undertaking, but also represent an opposition of types of human character. Both come to grief: Nicias, the overcautious leader of the expedition, who earns a not inevitable defeat by his ever-delaying tactics, and Alcibiades, who does

not stop at treachery or treason when the moment seems ripe for action which, if quickly taken, may succeed.

Aristotle and Aquinas would use such facts to argue against what, in their view, is the misconception of the prudent man as the opposite of the impetuous. The prudent man, in their opinion, does not stand at the other extreme of undue caution. In their theory of the virtues as means between extremes of excess and defect, prudence, like courage or temperance, represents a mean consisting in neither too much nor too little. As cowardice and foolhardiness are the opposite vices of too much and too little fear—and as both are opposed to the mean of courage which involves a moderation of fear—so excessive caution and impetuosity are the vices opposed to prudence as well as to each other.

Nor are prudence and imprudence simply matters of temperament. Men may differ in their temperamental dispositions; but, according to Aristotle and Aquinas, these are not to be confused with virtues and vices. One man may be by nature more fearful or fearless than another, but regardless of these differences in emotional endowment, either may become courageous, by forming the habit of controlling fear for the right reasons. So, too, one man may be naturally more impulsive or more circumspect than another, but either can acquire prudence through learning to take sufficient counsel and to deliberate enough before action, while also forming the habit of resolving thought into action by reaching decisions and commanding their execution. Failing to satisfy these conditions of prudence, either may develop the vices of imprudence, becoming, like Hamlet or Nicias, irresolute; or, like Alcibiades, impatient of counsel or ill advised, lacking care in deliberation and soundness in judgment.

THE CONCEPTION OF prudence as itself the extreme of caution, whether temperamental or habitual, is not the only challenge to the Aristotelian theory of prudence as a virtue. Other moralists, especially those who take a different view of virtue generally, do not seem to look upon prudence as wholly admirable. Even when they do not condemn prudence as an indisposition to act promptly or decisively

enough, they seem to give prudent deliberation the invidious connotation of cold and selfish calculation.

A suggestion of this appears in Mill's contrast between duties to ourselves and duties to others, wherein he remarks that "the term duty to oneself, when it means anything more than prudence, means self-respect and self-development." It would seem to be implied that prudence means something less—something more selfish—than a proper and justifiable self-interest, the violation of which involves "a breach of duty to others, for whose sake the individual is bound to have care for himself."

Kant, more explicitly than Mill, associates prudence with expediency and self-seeking, and separates it from action in accordance with duty under the categorical imperative of the moral law. Prudence has meaning only in relation to a hypothetical imperative "which expresses the practical necessity of an action as a means to the advancement of happiness." Granted that a man seeks his individual happiness, then "skill in the choice of means to his own greatest well being may be called *prudence*." Consequently, "the imperative which refers to the choice of means to one's happiness, *i.e.*, the precept of prudence, is still always hypothetical; the action is not commanded absolutely, but only as a means to another purpose," or, as Kant says elsewhere, "the maxim of self-love (prudence) only *advises*; the law of morality *commands*." Furthermore, he holds that "what *duty* is, is plain of itself to everyone; but what it is to bring true durable advantage, such as will extend to the whole of one's existence, is always veiled in impenetrable obscurity, and much prudence is required to adapt the practical rule founded on it to the ends of life, even tolerably, by making exceptions."

In terms of Kant's division of the imperatives of conduct into the pragmatic and the moral, according as they refer to welfare and happiness or duty and law, prudence is merely pragmatic. It does not belong to morality. The pragmatic imperative of prudence is more like the technical imperative of art, which is also conditional and concerned with determining means to an end—in this case, the thing to be produced by skill. "If it were only equally easy

to give a definite conception of happiness, the imperatives of prudence would correspond exactly with those of skill."

As Kant sees it, "the sole business of reason in the moral philosophy of prudence is to bring about a union of all the ends, which are aimed at by our inclinations, into one ultimate end—that of *happiness*, and to show the agreement which should exist among the means of attaining that end. In this sphere, accordingly, reason cannot present to us any more than *pragmatical* laws of free action, for our guidance towards the aims set up by the senses, and is incompetent to give us the laws which are pure and determined completely *a priori*." Hence the precepts of prudence "are used by reason only as counsels, and by way of counterpoise against seductions to an opposite course."

The issue between Kant and Aristotle (or Aquinas) with respect to prudence thus appears to be part of the larger issue between them on the fundamental principles of morality, discussed in the chapters on DUTY and HAPPINESS. In Kant's view, Aristotle and Aquinas, no less than Mill, are pragmatists rather than moralists. They are all utilitarians in the sense that they regard happiness as the first principle of human conduct and concern themselves with the ordering of means to this end. Since the consideration of means necessarily involves the weighing of alternatives as more or less expedient, prudence becomes indispensable to the pursuit of happiness. The choice of the best means is second in importance only to the election of the right end.

Kant admits that those who live for happiness require a great deal of prudence, in order to adapt practical rules to variable circumstances and to make the proper exceptions in applying them. None is required by those who live according to the moral law. "The moral law commands the most punctual obedience from everyone; it must, therefore, not be so difficult to judge what it requires to be done, that the commonest unpracticed understanding, even without worldly prudence, should fail to apply it rightly." That "the principle of *private* happiness" is "the direct opposite of the principle of morality" Kant seems to think is evident from the questionable worth of prudence; "for a man must have a different crite-

tion when he is compelled to say to himself: I am a *worthless* fellow, though I have filled my purse; and when he approves himself, and says: I am a *prudent* man, for I have enriched my treasure."

Kant does not limit his criticism of prudence as pragmatic—or practical rather than moral—to the fact that it serves what he calls "private happiness." It may serve the public welfare. "A history is composed pragmatically," he writes, "when it teaches *prudence*, i.e., instructs the world how it can provide for its interests better." But he also distinguishes between worldly and private prudence. "The former is a man's ability to influence others so as to use them for his own purposes. The latter is the sagacity to combine all these purposes for his own lasting benefit." Nevertheless, the prudence which aims at individual happiness is primary, for "when a man is prudent in the former sense, but not in the latter, we might better say of him that he is clever and cunning, but, on the whole, imprudent."

THOSE WHO TAKE THE view that happiness is the first principle of morality would still agree with Kant that the man who is skillful in exercising an influence over other men so as to use them for his own purposes, is clever or cunning rather than prudent. Hobbes, for example, says that if you permit to prudence "the use of unjust or dishonest means . . . you have that Crooked Wisdom, which is called Craft." Aristotle goes even further in his insistence that "it is impossible to be practically wise without being good," or, as the same point is made in the language of Aquinas, "one cannot have prudence unless one has the moral virtues; since prudence is right reason about things to be done, to which end man is rightly disposed by moral virtue."

"To be able to do the things that tend towards the mark we have set before ourselves" is, according to Aristotle, to be clever. "If the mark be noble, the cleverness is laudable, but if the mark be bad, the cleverness is mere smartness." Hence the man of prudence has a certain cleverness, but the clever man who is merely smart cannot be called practically wise. By this criterion the clever thief who plans and executes a successful robbery, the shrewd busi-

nessman who, without regard to justice, calculates well how to maximize his profits, or Machiavelli's prince who exercises cunning to get or keep his power, exhibits, not prudence, but its counterfeits. In some cases, the cleverness or shrewdness may simulate prudence without involving the knavery of craft or cunning. Some men have what Aquinas conceives as artistic (or technical) rather than moral prudence. Those who are "good counsellors in matters of warfare or seamanship are said to be prudent officers or pilots, but not simply prudent. Only those are simply prudent who give good counsel about all the concerns of life."

Aristotle and Aquinas make the relation between prudence and moral virtue reciprocal. The moral virtues depend, for their formation and endurance, as much upon prudence as prudence depends upon them. "Virtue makes us aim at the right end," Aristotle writes, "and practical wisdom makes us take the right means." The rightness of the means requires not merely that they be adapted to an end, but that the end itself be right. The right end cannot be achieved unless the means to it be rightly chosen. Hence no skill of mind in deliberating about and choosing means is truly the intellectual virtue of prudence unless the man who habitually calculates well is also habitually inclined by the moral virtues to choose things for the right end, whether that be happiness or the common good of society.

Conversely, the moral virtues depend upon prudence because, in Aristotle's view, they are formed by the making of right choices. His definition of moral virtue names prudence as an indispensable cause. Since the mean between extremes, in which the virtues consist, is in most cases subjective or relative to the individual, it cannot be determined by objective measurements. Reason must determine it by a prudent consideration of the relevant circumstances.

The interdependence of prudence and the moral virtues seems to be the basis, for both Aristotle and Aquinas, of the insight that it is impossible to have one moral virtue without having all. On this basis, Aristotle says, we can "refute the dialectical argument . . . that the virtues exist in separation from one another."

As no moral virtue can exist apart from practical wisdom, so with it, all must be present

Aquinas mentions another intellectual virtue as indispensable to the moral virtues, namely, the virtue of understanding which consists in knowing the first principles in practical as well as speculative matters. The first principles of the practical reason (*i.e.*, the precepts of the natural law) underlie prudence as well as the moral virtues. Just as sound reasoning in speculative matters "proceeds from naturally known principles . . . so also does prudence which is right reason about things to be done." Nevertheless, though prudence and the moral virtues depend upon it, Aquinas does not include understanding—as he does not include art, science, and wisdom—in his enumeration of the four cardinal virtues, cardinal in the sense of being the virtues indispensable to a good human life.

THESE MATTERS, especially the interconnection of the virtues and the theory of the cardinal virtues, are discussed in the chapter on VIRTUE. The problem of the relative worth of the moral and the intellectual virtues is also considered there and in the chapter on WISDOM, where the contributions to happiness of prudence and wisdom—or of practical and speculative wisdom—are specifically compared.

Here there remains to be considered the Socratic conception of the relation between knowledge and virtue, for there seems to be an issue between his theory of this matter and the foregoing view of the relation between prudence and the moral virtues.

In the *Meno*, Socrates argues that whatever a man desires or chooses he either knows or deems to be good. The man who chooses something evil for himself does not do so knowingly, but only through the mistake of deeming that which is in fact evil to be advantageous or good. Except for such mistakes, "no man," says Socrates, "wills or chooses anything evil." Apart from error or ignorance, evil is never voluntarily chosen. Hence, if virtue consists "in willing or desiring things which are good, and in having the power to gain them," it would seem to follow that knowledge of the good is closely related to its practice.

Subsequently, Socrates suggests that "if

there be any sort of good which is distinct from knowledge, virtue may be that good, but if knowledge embraces all good, then we shall be right in thinking that virtue is knowledge." To test these hypotheses, he proceeds to consider the various things which—whether or not they are the same as virtue—are like virtue in being advantageous to men. None of these things, such as courage or temperance, seems to profit men unless accompanied by what, in English translations, is sometimes called "wisdom" and sometimes "prudence."

Socrates points out that "everything the soul attempts, when under the guidance of wisdom"—or prudence—"ends in happiness; but in the opposite when under the guidance of folly"—or imprudence. "If then," he says, "virtue is a quality of the soul, and if it be of necessity always advantageous, then virtue must be wisdom or prudence, since none of the things of the soul are either advantageous or hurtful in themselves, but they are all made advantageous or hurtful by the addition to them of prudence or imprudence"—wisdom or folly. From this, says Socrates, we can conclude that "prudence is virtue, either the whole of virtue or some part of it at least"—or, as this is sometimes translated, "virtue is either wholly or partly wisdom."

In the light of his own view that all the moral virtues depend on practical wisdom, Aristotle criticizes the Socratic position. "Socrates in one respect was on the right track while in another he went astray. In thinking that all the virtues were forms of practical wisdom he was wrong, but in saying that they implied practical wisdom he was right. . . . Socrates thought the virtues were rules or rational principles . . . while we think they involve a rational principle." Similarly, in considering the question whether there can be moral without intellectual virtue, Aquinas writes: "Although virtue be not right reason, as Socrates held, yet not only is it *according to right reason*, insofar as it inclines a man to do that which is in accord with right reason as the Platonists maintained, but it also needs to be *joined with right reason*, as Aristotle declares."

Aquinas furthermore interprets the opinion that "every virtue is a kind of prudence," which he attributes to Socrates, as meaning

that when "a man is in possession of knowledge, he cannot sin, and that everyone who sins does so through ignorance." This, he says, "is based on a false supposition, because the appetitive faculty obeys the reason, not blindly, but with a certain power of opposition." Nevertheless, "there is some truth in the saying of Socrates that so long as a man is in possession of knowledge he does not sin; provided that this knowledge involves the use of reason in the individual act of choice."

Whether those who criticize the position of Socrates accurately perceive his intention and state the issue fairly are problems of interpretation as difficult as the question of where in this matter the truth lies. If Socrates is saying that a man will do good if he knows the good, what sort of knowledge is implied—knowledge of the good in general or knowledge of what is good in a particular case? Do both types of knowledge of the good lead as readily or surely to good or virtuous action?

Whether or not, in addition to knowledge, a good will or right desire is essential, it may be held that prudence is required to apply moral principles—aiming at the good in general—to particular cases. "There exists no moral system," writes Mill, "under which there do not arise unequivocal cases of conflicting obligation. These are the real difficulties, the knotty points, both in the theory of ethics and in the conscientious guidance of personal conduct. They are overcome practically, with great or less success, according to the intellect and virtue of the individual." Mill seems to imply that both prudence and virtue are essential to good action on the level of particulars, and that without them the kind of knowledge which is expressed in moral principles does not necessarily lead a man to act well.

ONE OTHER PROBLEM OF INTERPRETATION must be mentioned. It occurs with respect to Aristotle's statement concerning diverse modes of prudence.

"Political wisdom and practical wisdom are the same state of mind," he writes, "but their essence is not the same. Of the wisdom concerned with the city, the practical wisdom which plays a controlling part is legislative wisdom, while that which is related to this as par-

ticulars to their universal is known by the general name of 'political wisdom' . . . Practical wisdom also is identified especially with that form of it which is concerned with the individual man, and this is known by the general name 'practical wisdom.' Of the other kinds, one is called domestic, another legislative, a third political; and of this last, one part is called deliberative and the other judicial."

Does this mean that skill of mind in determining the best means to an end is different according to differences in the end—whether the happiness of an individual or the common good of a society? Does it mean, furthermore, that the prudence involved in managing a household is different from the prudence concerned with political affairs; and that, in the state, the prudence of the ruler (prince or statesman) is different from the prudence of the ruled (subject or citizen), because the one moves on the level of general laws, the other on the level of particular acts in compliance with law? Within the sphere of jurisprudence, or the prudence of laws, is the prudence of the legislator or lawmaker different from the prudence of the judge who applies the law?

In his *Treatise on Prudence*, Aquinas answers these questions affirmatively. He distinguishes between private, domestic, and political prudence, and within the political sphere places special emphasis upon what he calls "reignative prudence," the sort of prudence Dante calls "a kingly prudence," which sets the prince apart from ordinary men. Hobbes, on the other hand, asserts that "to govern well a family and a kingdom, are not different degrees of prudence, but different sorts of business; no more than to draw a picture in little, or as great, or greater than life, are different degrees of art."

This issue is intimately connected with the problem of the forms of government. If only a few men are fitted by nature to acquire the special mode of prudence which is reignative or legislative, would not government by the few or by the one seem to be naturally best? If, however, in a republic, those who are citizens rule and are ruled in turn, should not each citizen have the prudence requisite for both tasks, whether it be the same or different? Finally, if the democratic theory is that all men

are capable of being citizens—though not all, perhaps, are equally eligible for the highest public offices—must not political prudence be conceived as attainable by all men?

The question remains open whether those who deserve the highest magistracies have a

special mode of reignative prudence; or merely a higher degree of the same prudence by which they govern their private lives and their domestic establishments; or, as Hobbes suggests, have other abilities whereby they can apply the same prudence to a different kind of business.

OUTLINE OF TOPICS

	PAGE
1. The nature of prudence: as practical wisdom, as a virtue or quality of the deliberative mind	480
2. The place of prudence among the virtues of the mind	481
2a. Practical or political wisdom distinguished from speculative or philosophical wisdom	
2b. Prudence distinguished from art: action or doing contrasted with production or making	
2c. The relation of prudence to intuitive reason or to the understanding of the natural law: the moral perception of particulars	
3. The interdependence of prudence and the moral virtues: the parts played by deliberation, will, and emotion in human conduct	
3a. Moral virtue as determining the end for which prudence makes a right choice of means: right desire as the standard of practical truth	482
3b. Prudence as a factor in the formation and maintenance of moral virtue: the determination of the relative or subjective mean	
3c. Shrewdness or cleverness as the counterfeit of prudence: the abuses of casuistry	
3d. Prudence, continence, and temperance	
3e. The vices of imprudence: precipitance and undue caution	483
4. The sphere of prudence	
4a. The confinement of prudence to the things within our power: the relation of prudence to free will, choice, and deliberation	
4b. The restriction of prudence to the consideration of means rather than ends	484
5. The nature of a prudent judgment	
5a. The conditions of prudent choice: counsel, deliberation, judgment	
5b. The acts of the practical reason in matters open to choice: decision and command, leading to execution or use	485
5c. The maxims of prudence	
6. Prudence in relation to the common good of the community	
6a. Political prudence: the prudence of the prince or statesman, of the subject or citizen	
6b. Jurisprudence: prudence in the determination of laws and the adjudication of cases	486

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in **4** HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in **53** JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in **7** PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) II *Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 74: PUNISHMENT

INTRODUCTION

THE problem of punishment divides into a number of questions. In what does punishment consist? What purpose should punishment serve, or what should be its principle or reason? Who has the authority to punish and under what conditions shall this authority be exercised? Who shall be punished and who shall be exempt from punishment? What are the forms or kinds of punishment? Are any of these reprehensible either in principle or for their consequences? Should there be a proportion between the severity of punishment and the gravity of the offense? Can a person punish himself? Do men desire to be punished?

These questions apply, though not with equal emphasis, to the three major types of wrongdoing in relation to which men discuss the nature and the need of punishment, its justice or its expediency. Punishment is traditionally considered in relation to vice, to crime, and to sin. According to the type of wrongdoing being considered, the punitive agent may be the wrongful individual himself or his family, his state, his church or God.

The lines which separate these areas of the problem of punishment cannot be sharply drawn in all cases, for as certain acts simultaneously violate the moral, the civil, and the divine law, they may also cause a person to be simultaneously subject to punishment from diverse sources. The wrong or injury which punishment is supposed to redress may in some cases fall under none of these headings, as, for example, acts of war or rebellion. It is sometimes questioned whether the theory of punishment remains the same when punitive steps are taken by one state against some or all the people of another; or again, when a government applies penalties for a rebellion engaged in by members of its own community.

In this chapter, we shall deal with the prob-

lem of punishment in its most general terms, for the most part considering the foregoing questions without regard to the distinction of sin, crime, and vice; or to the differences between divine and human punishment, or between punishment by the state and in the family (*i.e.*, punishment as involved in the enforcement of law and punishment as an instrument of education or training). These more specialized topics belong to other chapters: *e.g.*, punishment as affecting the formation of character to the chapters on EDUCATION and VIRTUE AND VICE; punishment as administered by parents to the chapter on FAMILY; divine rewards and punishments to the chapters on IMMORTALITY and SIN.

The basic ideas in terms of which any discussion of punishment proceeds are, of course, the subjects of the chapters on JUSTICE and LAW. One other chapter—PLEASURE AND PAIN—is of peculiar relevance to the question about the nature of punishment. Concerning the nature of punishment there seems to be no great difference of opinion in the tradition of western thought. Punishment is generally conceived as the infliction of pain, though some writers distinguish between corporeal and spiritual punishment according as the pain inflicted is the pain of sense or the pain of deprivation and loss. Imprisonment, for example, always entails the pain of loss—the loss of freedom—but it may also carry with it the suffering of physical hardships or even tortures. The torment of the damned is, according to some theologians, both corporeal and spiritual—the agony of hell-fire and the anguish of the soul deprived of God's love and presence.

IF THERE IS LITTLE DISPUTE about the nature of punishment, the opposite situation prevails concerning its purpose. Why men should be

punished is one of the most controversial questions in the field of moral and political thought, and in psychology and theology as well.

The major opposition in the tradition of the great books is between those who think that punishment need only be inherently just, and those who think it cannot be justified without reference to its utility or expediency. While this debate goes on, for more than twenty centuries, punishments in actual practice—whether in accordance with the law or uncontrolled by it—tend generally to be severe and often fiendish or ferocious. Not until Beccaria in the 18th, and Bentham in the 19th century, does the discussion of punishment lead to major reforms in the spirit and provisions of the penal codes. But the opposite positions in the debate across the centuries are never without practical significance for penal institutions and punitive measures even when theory is not immediately reflected in practice. The speculative significance of the issue is, however, always immediately apparent. Although justice and law are more fundamental and comprehensive ideas than punishment, this one problem of punishment—the question of its purpose—critically tests the meaning of anyone's theory of law and justice.

It may be that the issue cannot be fairly stated in terms of *purpose*. To use that word may beg the question, since one of the basic positions in the controversy appears to be that punishment has no purpose in the sense of *serving some end beyond itself*, or producing some desired consequence *in the future*. This is the theory—shared by Kant and Hegel—that punishment should be purely retributive.

According to this view the effect of the punishment upon the wrongdoer, or upon others whose conduct may be affected by punishments meted out or threatened, must not be taken into account at all. Nothing should be sought except the preservation of the balance sheet of justice, by seeing that every wrong is duly requited by a proportionate measure of punishment. Nor is the requital purely retributive if it considers any person except the wrongdoer himself. That punishment of the transgressor may assuage the feelings of those he has injured, or even satisfy a desire for revenge, should have no motivating force. The only pleasure the spectacle of punish-

ment should yield, the only desire it should satisfy, is that of seeing the moral law upheld. We should punish only because we have, under the moral law, a duty to do so.

Kant castigates as utilitarian every theory of punishment which directs it to the service of anything besides strict justice—such as the reformation of the criminal, the deterrence of others, the welfare of society, or the slaking of the thirst for vengeance. "Juridical punishment," he says, "can never be administered merely as a means for promoting another good, either with regard to the Criminal himself, or to Civil Society, but must in all cases be imposed only because the individual on whom it is inflicted *has committed a Crime*. . . . The Penal Law is a Categorical Imperative; and woe to him who creeps through the serpent-windings of Utilitarianism to discover some advantage that may discharge him from the Justice of Punishment, or even from the due measure of it."

What shall determine the mode and measure of punishment? Kant answers: "It is just the Principle of Equality by which the pointer of the Scale of Justice is made to incline no more to one side than the other. It may be rendered by saying that the undeserved evil which anyone commits on another, is to be regarded as perpetrated on himself. . . . This is the Right of Retaliation (*ius talionis*); and properly understood it is the only Principle which . . . can definitely assign both the quality and the quantity of a just penalty. All other standards are wavering and uncertain; and on account of other considerations involved in them, they contain no principle conformable to the sentence of pure and strict Justice."

RETRIBUTIVE PUNISHMENT or retaliation seems to express the principle of justice or fairness in exchange. The Mosaic injunction that "thou shalt give life for life, eye for eye, tooth for tooth, burning for burning, wound for wound, stripe for stripe," occurs in the context of other passages which declare the compensation in goods which an injured party shall receive for the loss of or damage to his chattel. But it is also accompanied by ordinances which impose the death penalty for wrongs other than the taking of a life.

"You have heard," Christ declares in the Sermon on the Mount, "that it hath been said, An eye for an eye, and a tooth for a tooth. But I say unto you, That ye shall resist not evil; but whosoever shall smite thee on thy right cheek, turn to him the other also. And if any man will sue thee at the law, and take away thy coat, let him have thy cloak also." This passage has sometimes been taken to mean that all punishment is simply vengeance; and that instead of returning injury for injury, the Christian should love his enemies and forgive them. "If you think someone has wronged you," Princess Mary says to Prince Andrew in *War and Peace*, "forget it and forgive! We have no right to punish."

But the Christian view of punishment may not be the same when the punishment of the evildoer is a question for the state rather than for the individual. "Avenge not yourselves," St. Paul commands; "for it is written, Vengeance is mine, I will repay, saith the Lord." The individual need not avenge himself, for God punishes the wicked; not only God, but the ruler of the earthly state who, St. Paul says, "is the minister of God to thee for good. But if thou do that which is evil, be afraid; for he beareth not the sword in vain; for he is the minister of God, a revenger to execute wrath upon him that doeth evil."

A life for a life appears to be the symbolic statement of the *lex talionis* in the Greek as well as the Hebrew tradition. "Justice claims aloud her debt," the Chorus explains in the *Choephore* of Aeschylus. "Who in blood hath dipped the steel, deep in blood her meed shall feel. . . . Whoso'er shall take the sword, shall perish by the sword." But as Aristotle points out—and similarly Aquinas in his comment on the *lex talionis* of the Old Testament—simple reciprocity does not determine the mode of retribution. "People want even the justice of Rhadamanthus to mean this: Should a man suffer what he did, right justice would be done." Yet, Aristotle points out, "in many cases, reciprocity and rectificatory justice are not in accord, e.g., if an official has inflicted a wound, he should not be wounded in return, and if someone has wounded an official, he ought not to be wounded only but punished in addition." Retaliation consists in reciprocity only if it is "in accordance with a

proportion, and not on the basis of a precisely equal return."

Punishment as retaliation may seem to be inseparable from revenge. Yet, according to Lucretius, the surrender of primitive freedom for the restrictions of civilized life is motivated by the desire to substitute equitable retribution for unlimited vengeance. "Mankind, tired out with a life of brute force, lay exhausted from its feuds; and therefore the more readily it submitted of its own free will to laws and stringent codes. As each man moved by anger took measures to avenge himself with more severity than is now permitted by equitable laws, for this reason men grew sick of the life of brute force."

Hegel tries to clarify what he regards as a popular confusion of retribution with revenge. "In that condition of society," he writes, "when there are neither magistrates nor laws, punishment always takes the form of revenge; revenge remains defective inasmuch as it is the act of a subjective will." It is understandable that retribution should be objected to on the ground that "it looks like something immoral, i.e., like revenge, and that thus it may pass for something personal. Yet it is not something personal but the concept itself which carries out retribution. 'Vengeance is mine, saith the Lord,' as the Bible says. . . . The Eumenides sleep, but crime awakens them, and hence it is the very act of crime itself which vindicates itself."

The apparent contradiction in the identity and difference of retribution and revenge can, in Hegel's opinion, be resolved. On the one hand, it can be said that "the annulment of crime is retribution insofar as retribution in *conception* is an 'injury of the injury.'" On the other hand, it can be said that "the annulling of crime in this sphere where right is immediate is principally revenge, which is just in its content insofar as it is retributive." The demand that this contradiction be resolved "is the demand for justice not as revenge but as punishment."

Hegel's resolution seems to be in terms of a distinction between the particular and the universal. "When the right against crime has the form of revenge, it is only right implicit, not right in the form of right, i.e., no act of revenge is justified. Instead of the injured party, the injured *universal* now comes on the scene, and this

has its proper actuality in the court of law. It takes over the pursuit and the avenging of crime, and this pursuit consequently ceases to be the subjective and contingent retribution of revenge, and is transformed into the genuine reconciliation of right with itself, *i.e.*, into punishment."

On this conception of punishment, Hegel like Kant decries every utilitarian purpose for punishment. Such misconceptions of punishment arise, he says, from the supposition that both crime and its annulment are "unqualified evils," which makes it seem "quite unreasonable to will an evil merely because 'another evil is there already.' To give punishment this superficial character of an evil is, amongst the various theories of punishment, the fundamental presupposition of those which regard it as a preventive, a deterrent, a threat, as reformatory, etc., and what on these theories is supposed to result from punishment is characterized equally superficially as a good. But . . . the precise point at issue is wrong and the righting of it. If you adopt that superficial attitude toward punishment, you brush aside the objective treatment of the righting of wrong."

THE ISSUE WOULD SEEM to be a conflict between justice and expediency, with the utilitarians identifying retribution with revenge and demanding that punishment serve some good or mitigate some evil. But sometimes the question is whether justice and expediency are compatible.

In the debate on the treatment of the Mytilenians, which Thucydides reports, Cleon calls upon the Athenians to show no mercy to their rebellious subjects. "Their offence," he says, "was not involuntary, but of malice and deliberate," and they deserve to be punished. "If you follow my advice, you will do what is just towards the Mytilenians, and at the same time expedient. . . . For if they were right in rebelling, you must be wrong in ruling. However, if, right or wrong, you determine to rule, you must carry out your principle and punish the Mytilenians as your interest requires."

Diodotus objects to the policy of putting the Mytilenians to death on the ground that it is not a question of justice but of expediency. "We are not in a court of justice," he says, "but

in a political assembly; and the question is not justice, but how to make the Mytilenians useful to Athens. . . . I consider it far more useful for the preservation of our empire to put up with injustice, than to put to death, however justly, those whom it is our interest to keep alive. As for Cleon's idea that in punishment the claims of justice and expediency can both be satisfied, facts do not confirm the possibility of such a combination."

In the chapter on justice in *Utilitarianism*, Mill seems to place justice above expediency, but he also seems to reduce retribution to revenge and call it just. "The sentiment of justice," which includes as "one of its elements . . . the desire to punish," Mill identifies with "the natural feeling of retaliation or vengeance." Retribution, or the giving of "evil for evil," he says, "becomes closely connected with the sentiment of justice and is universally included in the idea." The principle of "giving to each what they deserve," he adds, "that is, good for good as well as evil for evil, is not only included within the idea of Justice as we have defined it, but is a proper object of that intensity of sentiment, which places the Just, in human estimation, above the simply Expedient."

Other writers seem to think that the utility of punishment is not incompatible with its retributive justice. The great theologians, for example, considering the difference between the eternal punishment of the damned in Hell, and the cleansing punishment of the repentant in Purgatory, do not find it impossible for divine justice to include both absolute retribution and punishment which may be remedial as well as retributive. Purely retributive punishment seems justifiable to them, but they do not think that punishment can ever be justified simply by its utility—by the good it achieves—without any reference to the retaliation of evil for evil.

In the context of saying that the institution of slavery among men is a just punishment for Adam's sin, and that "God knows how to award fit punishments for every variety of offence," Augustine observes that "we must not only do harm to no man, but also restrain him from sin or punish his sin, so that either the man himself who is punished may profit by his experience or others be warned of his example." Here there

seems to be no thought that retribution excludes a reformatory or deterrent use of punishment. Aquinas even more explicitly combines the remedial and the deterrent utility of punishment with the function of punishment to preserve the order of justice by meting out an equitable retribution.

In willing justice, God wills punishment, according to Aquinas. "The order of justice belongs to the order of the universe; and this requires that penalty should be dealt out to sinners." But just retribution is not the only reason for punishment. Sometimes it is "for the good of those who are punished," sometimes "for the amendment of others." These reasons for punishment apply to human as well as to divine law. "When a thief is hanged, this is not for his own amendment, but for the sake of others, who at least may be deterred from crime through fear of punishment." Punishment is a proper effect of human law, not merely because justice requires it, but because "the law makes use of the fear of punishment in order to ensure obedience."

In discussing the proportion between the severity of the penalty and the gravity of the fault in the punishment of sin under the Mosaic law, Aquinas explains that in addition to the reason of justice (that "a greater sin, other things being equal, deserves a greater punishment"), there is the purpose of reformation ("since men are not easily cured of habitual sin except by severe punishments") and the purpose of prevention ("for men are not easily deterred from such sins unless they be severely punished"). Here three reasons for punishment are stated side by side. But in the opinion of Aquinas retribution is more than the primary, it is the one indispensable reason; for punishment cannot be justified except as doing the work of justice.

THE VIEW OF KANT AND Hegel that retribution or retaliation is *the only basis* for punishment—not merely the primary or the indispensable reason—meets its exact opposite in what appears to be the completely utilitarian theory of punishment to be found in the writings of Plato, Hobbes, Locke, and Rousseau.

In the *Protagoras*, arguing for the proposition that virtue can be taught, Protagoras insists

that "no one punishes the evil-doer for the reason that he has done wrong—only the unreasonable fury of a beast acts in that manner. But he who desires to inflict rational punishment does not retaliate for a past wrong which cannot be undone. He has regard to the future, and is desirous that the man who is punished, and he who sees him punished, may be deterred from doing wrong again. He punishes for the sake of prevention, thus clearly implying that virtue is capable of being taught."

Plato himself seems to adopt the opinion of Protagoras. In the *Laws*—wherein he sets forth the provisions of a penal code in a detail equalled, in the tradition of the great books, only by the proposals of Hobbes—Plato says no man is to be punished "because he did wrong, for that which is done can never be undone, but in order that, in the future times, he, and those who see him corrected, may utterly hate injustice, or at any rate abate much of their evil-doing." Yet he also goes on to say that the law "should aim at the right measure of punishment, and in all cases at the deserved punishment." This qualification seems, in turn, to be balanced by his remarks on the death penalty which he thinks should be imposed only on the incurable who cannot profit from punishment and whose execution "would be an example to other men not to offend."

The notion of desert in Plato's theory of punishment appeals to justice without implying any separation between retribution and reform. In the *Gorgias*, Socrates says that "to suffer punishment is another name for being justly corrected when you do wrong." A wrongdoer who escapes punishment suffers a greater evil than one who is punished, for he "who is punished and suffers retribution, suffers justly." Thereby justice is restored to his soul. The judge who prescribes just punishments cures the soul, as the physician who prescribes the right remedies cures the body. The criminal who, having been unjust, goes unpunished "has no deliverance from injustice."

The fact that just punishments are deserved does not seem to be the reason why men should be punished. Considering the penalties imposed by gods and men, in the next world or in this, Socrates summarizes his argument by saying that "the proper office of punishment is two-

fold: he who is rightly punished ought either to become better and profit by it, or he ought to be made an example to his fellows, that they may see what he suffers, and fear and become better. Those who are improved when they are punished by gods and men, are those whose sins are curable; and they are improved, as in this world so also in another, by pain and suffering."

Like Plato, Hobbes places the reason for punishment in the future rather than in the past—in its utility to procure certain effects rather than in its effecting retaliation. He states it as a law of nature that "in revenges (that is, retribution of evil for evil), *men look not at the greatness of the evil past, but the greatness of the good to follow*. Whereby we are forbidden to inflict punishment with any other design than for the correction of the offender, or the direction of others." Anything else he calls "an act of hostility."

The chief aim of punishment, in securing the reformation and the deterrence of criminals, Hobbes thinks, is to maintain public peace. "A punishment is an evil inflicted by public authority" on those who have transgressed the law, "to the end that the will of men may thereby the better be disposed to obedience." A law, without a penalty attached, is "not a law, but vain words." It fails to achieve the end of law, which is the same as the end of punishment. The worst offenses—those to be prevented by the most severe penalties—are crimes, not against individuals, but those that "are of most danger to the public."

Locke also derives from natural law the right to punish those who transgress that law, "for restraint and preventing the like offence," to which he adds that "each transgression may be punished to that degree, and with so much severity as to make it an ill bargain to the offender, give him cause to repent, and terrify others from doing the like." This theory of punishment applies not only to man living in a state of nature, but in civil society as well.

Though Rousseau describes the wise statesman as one who knows how, by punishing crimes, to prevent them, he lays greater emphasis on the other motive for punishment—the reformation of the criminal. "There is not a single ill-doer who could not be turned to some good. The State has no right to put to death,

even for the sake of making an example, anyone whom it can leave alive without danger." Or, as Fetyukovitch says in his address to the jury in the *Brothers Karamazov*: "The Russian court does not exist for punishment only, but also for the salvation of the criminal. Let other nations think of retribution and the letter of the law, we will cling to the spirit and the meaning—the salvation and the reformation of the lost."

THIS GREAT ISSUE CONCERNING the reason for or purpose of punishment seems to affect most of the other questions which men raise about the penalties to be imposed for wrongdoing—whether the wrong is a sin, a crime, or a vicious act, and whether it is God or the state, nature or the individual himself, who inflicts the pain. The reverse also seems to be true. These other questions raise difficulties or issues which test the conflicting theories that punishment should be a just retaliation *exclusively*, or should be justified *only* by its consequences, or should somehow be a *combination* of awarding just deserts and securing good effects.

For example, the question of how the various modes and measures of punishment should be determined and assigned to diverse acts of wrongdoing does not seem to be answerable in the same way when the principle is simply retribution and when the purpose of punishment is reformation and deterrence. On the principle of retribution the gravity of the offence appears to be the only determinant of the severity of the punishment. The punishment should fit the crime, not the nature of the criminal as someone capable of being benefitted by punishment.

Kant and Hegel do not think that the justification of the death penalty, for example, depends on the curability or incurability of the offender. Nor do they think that the taking of the criminal's life should be motivated, as Aquinas and Locke seem to suggest, by the desire to protect society from his future depredations. It is sufficient that he has taken a life, or committed some equally serious injury, which ought to be repaid by a proportionate requital.

"What is involved in the action of the criminal," Hegel writes, "is not only the concept of crime, the rational aspect in crime as such

whether the individual wills it or not, the aspect which the state has to vindicate, but also the abstract rationality of the individual's *volition*. Since that is so," Hegel argues, "punishment is regarded as containing the criminal's right and hence by being punished he is as honored as a rational being. He does not receive this due of honor unless the concept and measure of his punishment are derived from his own act. Still less does he receive it if he is treated either as a harmful animal who has to be made harmless, or with a view to deterring or reforming him."

On these grounds, Hegel criticizes Beccaria's unqualified opposition to the death penalty. In addition, he rejects Beccaria's theory that "it could not be presumed that the readiness of individuals to allow themselves to be executed was included in the social contract." Rousseau takes the diametrically opposite view. He argues for the death penalty on the ground that "we consent to die if we ourselves turn assassins" in order to protect ourselves from falling victims to assassins. In making this consent a part of the social contract, Rousseau holds that "we think only of securing [our own lives], and it is not to be assumed that any of the parties then expects to get hanged."

Hegel disagrees with both Beccaria, and Rousseau. According to him, the state is not based upon a social contract; nor does he admit that "its fundamental essence [involves] the unconditional protection and guarantee of the life and property of members of the public as individuals. On the contrary," he holds, "it is that higher entity"—the state—"which even lays claim to this very life and property and demands its sacrifice."

The state, therefore, according to Hegel, cannot be denied the right of inflicting capital punishment. Hegel admits that "Beccaria's requirement that men should give their consent to being punished is right enough," but he adds that "the criminal gives his consent already by his very act. The nature of the crime, no less than the private will of the individual, requires that the injury initiated by the criminal should be annulled. However that may be," he continues, "Beccaria's endeavor to have capital punishment abolished has had beneficial effects." Because of the efforts made by Joseph

II and Napoleon to abolish it, "we have begun to see," Hegel thinks, "which crimes deserve the death penalty and which do not. Capital punishment has in consequence become rare, as in fact should be the case with this most extreme punishment."

The attitude toward the death penalty as well as toward all other punishments is different when the *only* purpose of punishment is the welfare of society and the improvement of individuals, whether they are actual or potential offenders. The modes and degrees of punishment must then be determined by considering their effectiveness as means to the ends in view. Montesquieu discusses the penal codes in various systems of law entirely in terms of their success in preventing crime. Though he does not seem to think that punishment can improve the character of the individual, he believes that a certain proportion between the penalty and the offense may tend to reduce the extent and gravity of crimes. "In Russia," he says, "where the punishment of robbery and murder is the same, they always murder."

In general, Montesquieu is opposed to unduly severe punishments, and especially to cruel and unusual punishments, not so much on the grounds of injustice as for the protection of liberty and public morals. Hobbes, Locke, and Rousseau similarly discuss the severity of punishment with reference to its utility, and, like Montesquieu, they face the problem that the same measure or degree of punishment may not be equally effective for the purposes of reformation and deterrence. Severe penalties, for example, may have a greater deterrent effect upon potential offenders than milder forms of punishment, but they may also tend to harden criminals instead of reforming them.

The conflict of principles in the determination of punishments seems to be even more marked in the case of those who try to combine retribution with utility. If, for example, the death penalty is the just desert for murder, should it be applied on the grounds of retribution, even though a particular murderer can be reformed by milder treatment? If heavy penalties were to prove highly effective as deterrents, should they be applied to minor offenses, which deserve less severe retaliations, in order to reduce the amount of crime?

THERE SEEMS TO BE AGREEMENT for the most part on who shall have the authority to punish and who shall be subject to punishment, in the relation of men to one another, to the state, and to God. Punishment seems to be annexed to law, as indispensable for its enforcement, so that whoever has the authority to set rules of conduct for another also has the authority to impose penalties for their violation. Yet the notion that punishment is a necessary sanction for law—which is apparently shared by those who take the retributive and those who take the utilitarian view of punishment—does not seem to fit both views equally well, at least not to the extent that the end of law and its enforcement is the common good or the public welfare.

Again, it seems to be generally agreed that moral responsibility on the part of offenders is an indispensable condition of just punishment for their misdeeds. Unless the sinful or the criminal act is voluntary, unless it is intentional rather than accidental—or if negligent, capable of being attributed to a willful error of judgment—the act is without fault and the agent without guilt. But although those who make punishment retributive and those who make it reformatory or deterrent seem to agree upon responsibility as prerequisite, this principle does not seem to be equally consistent with both theories—at least not to the extent that the exemplary punishment may deter others quite apart from the responsibility of the person punished.

The question of responsibility raises other difficulties, e.g., the metaphysical issue about personal identity, on which Locke takes the stand that unless the human individual is an enduring substance, he cannot deserve subsequent punishment for his prior acts; and the issue of free will and causality, on which Hume's position seems to be that unless human actions are subject to causal necessity, a man cannot be blamed for his acts or "become the object of punishment or vengeance."

Finally, there is the problem of a natural need for punishment and of the penalties which nature itself imposes for wrongdoing to fulfill this need. The familiar statement that virtue is its own reward and vice its own punishment, is sometimes interpreted to mean that virtue

and vice are intrinsically good and evil, and sometimes to mean that through their natural consequences they heap benefit or injury on their possessor.

Augustine, for example, says that by the sins which he committed God did justly punish him, for "every disorder in the soul is its own punishment"; and Kant distinguishes juridical from natural punishment "in which Crime as Vice punishes itself, and does not as such come within the cognizance of the Legislator." The other interpretation seems to be represented by Hobbes' theory that "intemperance is naturally punished with diseases . . . injustice with the violence of enemies . . . cowardice with oppression." In the chain of consequences started by any action, he discerns the pains which are "the natural punishments of those actions that are the beginning of more harm than good."

But according to Freud it is the craving for punishment rather than the punishment which is natural, i.e., psychologically determined. Individuals punish themselves or seek to be punished for what is either real or fancied guilt. "The unconscious need for punishment plays a part in every neurotic disease," Freud writes. "It behaves like a part of the conscience, like the prolongation of conscience into the unconscious; and it must have the same origin as conscience; that is to say, it will correspond to a piece of aggressiveness which has been internalized and taken over by the super-ego. If only the words were less incongruous, we should be justified . . . in calling it 'an unconscious sense of guilt.'"

Whatever its psychological validity, Freud's theory does not resolve the moral issue concerning the justice or utility of punishment. Nor does it eliminate the possibility of other motives for submitting to punishment voluntarily. Socrates in the *Crito* explains that he refuses to escape from the death penalty he thinks he does not deserve, in order to uphold the law which is itself just even though in his own case it has been unjustly applied by men. Thoreau and Gandhi refuse to obey laws their consciences cannot approve, but do not resist the state's demand that they be punished for the law's infraction. In an unjust society, going to prison is for them the necessary fulfillment of the revolution begun by civil disobedience.

OUTLINE OF TOPICS

	PAGE
1. The general theory of punishment	497
1a. The nature of punishment: the pain of sense and the pain of loss	
1b. The retributive purpose of punishment: the <i>lex talionis</i> ; retaliation and revenge; the righting of a wrong	
1c. Punishment for the sake of reforming the wrongdoer	499
1d. The preventive use of punishment: the deterrence of wrongdoing	
2. Personal responsibility as a condition of just punishment: the problem of collective responsibility	500
2a. Free will in relation to responsibility and punishment: voluntariness in relation to guilt or fault; the accidental, the negligent, and the intentional	
2b. Sanity, maturity, and moral competence in relation to responsibility	501
3. Punishment in relation to virtue and vice	
3a. Rewards and punishments as factors in the formation of moral character	
3b. Vice its own punishment	502
3c. Guilt, repentance, and the moral need for punishment	
4. Crime and punishment: punishment as a political instrument	
4a. Punishment for lawbreaking as a necessary sanction of law	503
4b. The forms of punishment available to the state	
(1) The death penalty: its justification	
(2) Exile or ostracism: imprisonment or incarceration	504
(3) Enforced labor or enslavement	
(4) Torture: cruel and unusual punishments	505
4c. The justice of legal punishment: the conventionality of the punishments determined by positive law	
4d. Grades of severity in punishment: making the punishment fit the crime	
5. The punishment for sin	506
5a. The origin and fulfillment of curses	
5b. The wages of sin: the punishment of original sin	
5c. The pain of remorse and the torment of conscience: the atonement for sin	507
5d. The modes of divine punishment: here and hereafter, temporal and eternal	508
5e. The justice of divine punishment	509
(1) The justification of eternal suffering in Hell or Hades	510
(2) The necessity of expiation in Purgatory	
6. Pathological motivations with respect to punishment: abnormal sense of sin or guilt; perverse desires to inflict or suffer punishment	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The general theory of punishment

1a. The nature of punishment: the pain of sense and the pain of loss

4 HOMER: *Odyssey*, BK XI [568-600] 248d-249a

7 PLATO: *Protagoras*, 45b-d

Chapter 75: QUALITY

INTRODUCTION

IT is sometimes supposed that the fundamental categories in terms of which men think they are describing reality or their experience merely reflect the conventions of their language. Substance and attribute—and among attributes, quality and quantity—happen to be fundamental categories in western thought, it is held, only because the group of languages which the western cultures use all have a grammatical structure that involves a distinction between noun and adjective and between different kinds of adjectives. It is said, for example, that Aristotle's enumeration of the categories is merely a verbal classification based on Greek grammar. When he says that the basic terms of discourse represent substances, qualities, quantities, relations, and so forth, he is recognizing the grammatical difference between such words as "man" and "white," or between "white" and "six feet tall" and "double." The lineaments of reality, the varieties of being, or the modes of experience are not, it is held, thereby finally described.

In the tradition of the great books, another interpretation generally prevails. Even those who disagree in one way or another about the basic categories do not regard them as conventional or of linguistic origin. Kant, for example, disagrees with Aristotle's listing of the categories. He makes substance a mode of relation rather than coordinate with quality, quantity, and relation. He calls his categories "transcendental" to indicate that they are not drawn from experience and that, as *a priori* forms of thought, they determine the structure of all possible experience. Aristotle, on the other hand, draws his categories from experience. He thinks that they represent fundamental modes of being and that they are, therefore, the basic concepts in terms of which thought apprehends reality. Despite all these differences, Kant and Aristotle agree that the categories signify real—

not verbal—distinctions. Their agreement on this point seems to be shared even by those, like Hume, who question our ability to know whether substances exist; or those, like Berkeley, who question the validity of the distinction between quality and quantity.

In one sense, no one questions the existence of qualities, as they do the existence of substances—the enduring things, material or otherwise, in which qualities are supposed to inhere. Everyone somehow acknowledges the hot and the cold, the light and the dark, the moist and the dry, the hard and the soft. But such acknowledgement does not preclude a number of basic questions about quality on which much disagreement exists.

Are qualities attributes? Do they exist, that is, only as *qualifiers*, only as belonging to something else? Or do they exist independently, in and of themselves? If qualities are attributes, do they belong to things quite apart from our experience of them, or do they belong to things only as experienced and have no separate reality? Do things have in reality certain attributes that cause in us the experience of other traits which we then attribute to the things themselves?

Are all the attributes of things, whether in or apart from experience, to be conceived as qualities, and if so, are there different kinds of qualities? Or is quality only one kind of attribute, and if so, how is quality related to other kinds of attributes? Is quality, for example, distinct from quantity, dependent on quantity, reducible to quantity, affected by quantity?

These questions appear to be related in ways which make the issues they raise dependent on one another. If, in addition, their presuppositions and implications are observed, it will be seen that they cannot be fully discussed without entering into matters considered in other chap-

ters, such as the notions of substance and accident in the chapter on BEING; the theory of experience and the various accounts of sense-perception and the objects of sense in the chapters on EXPERIENCE and SENSE; and, of course, some of the principal topics considered in the closely related chapter on QUANTITY.

SPINOZA DISTINGUISHES between substance and mode as that which exists in itself and that which exists in another thing. He lays down as an axiom that "everything which is, is either in itself or in another." Whether or not qualities are modes of substance, it seems to be clear that Spinoza would not call them substances. The notion of qualities existing in themselves, and not as the qualities of anything, seems to be self-contradictory. As Descartes points out, to assert "the existence of real accidents," by which he means the existence of qualities or quantities apart from substances, is to deny the distinction between substance and accident. "Substance," he writes, "can never be conceived after the fashion of accidents, nor can it derive its reality from them"; whereas "no reality can be ascribed to [accidents], which is not taken from the idea of substance."

Anyone who acknowledges the distinction between substance and accident also conceives qualities as accidents or attributes, *i.e.*, as existing in the things they qualify. Spinoza, Descartes, Locke, and Aristotle do not conceive substance in the same way, nor do they all use the word "accident" to name the characteristics which inhere in substance. Locke, for example, uses the word "quality" with almost the same generality that Spinoza gives to the word "mode," or Descartes and Aristotle to "accident." And the word "substance" Locke uses in a sense that is nearer to Aristotle's meaning for the word "matter," when, in trying to conceive bare substance as the underlying "I know not what," Locke defines this substratum as that which supports qualities. Apart from its qualities, substance has no positive characteristics.

Nevertheless, such differences in theory leave untouched the point of agreement that qualities do not float freely—without any support—in either reality or experience. Even Berkeley's denial of matter, or of bodies existing apart from

their being perceived, does not turn qualities into substances, for qualities *as perceived* are the qualities of bodies *as perceived*, and both together have their existence in the perceiver.

The contrary view—that qualities exist in and of themselves—does not seem to receive clear or explicit expression in the tradition of the great books. It may be implied in the conception of experience which Hume develops more fully in the *Treatise on Human Nature* than in the *Enquiry*. There it seems to be supposed that each element of experience has the same reality as any other; that each stands by itself without any perceptible dependence upon any other; and that it has no existence beyond its momentary appearance. On this view no enduring substances exist. In addition, it is as appropriate to call the elements of experience "qualities" as it is to call them anything else. Experience can be described as nothing but qualities and relations—or as qualities related by succession and contiguity.

The notion that experience is a continual flux in which nothing has a continuing identity from moment to moment, seems to be basic to any theory which denies substances and affirms the independent reality of qualities. The theory of qualities which Plato attributes to Heraclitus or his followers illustrates this. "Their first principle," Socrates tells Theaetetus, "is that all is motion, and upon this all the affections of which we were just now speaking are supposed to depend; there is nothing but motion, which has two forms, one active and the other passive, both in endless number; and out of the union and friction of them is generated a progeny endless in number, having two forms, sense and the object of sense."

For example, "when the eye and the appropriate object meet together and give birth to whiteness and the sensation connatural with it . . . then, while the sight is flowing from the eye, whiteness proceeds from the object which combines in producing the color. . . . This is true of all sensible objects, hard, warm, and the like, which are similarly to be regarded not as having any absolute existence, but as being all of them generated by motion in their intercourse with one another . . . for the agent has no existence until united with the patient, and the patient has no existence until united with the agent. . . .

And from all these considerations," Socrates says, "there arises a general reflection that there is no self-existent thing, but everything is becoming and in relation."

Socrates explains that, for those who assert a universal flux, qualities are not only the products of motion, but also are themselves in motion—"not even white continues to flow white, and whiteness itself is a flux or change which is passing into another color." There is no need to refute this doctrine, Socrates thinks, since it refutes itself by its unintelligibility or, worse, its inability to say anything definite in consequence of denying that words can have a constant meaning from moment to moment.

Aristotle concurs in this attitude toward "the most extreme view of the professed Heracliteans," but goes on to remark that "not even at different times does one sense disagree about the quality, but only about that to which the quality belongs. I mean, for instance, that the same wine might seem, if either it or one's body changed, at one time sweet and at another time not sweet; but at least the sweet, such as it is when it exists, has never yet changed." The sweet thing may become sour, either in itself or to us, but sweetness itself never becomes sourness.

THAT QUALITIES DO NOT change into one another, whereas substances undergoing alteration change from one quality to another, seems to Aristotle to distinguish quality from substance. "The most distinctive mark of substance," he writes, "appears to be that, while remaining numerically one and the same, it is capable of having contrary qualities. . . . Thus, one and the same color cannot be white and black. . . . But the same individual person is at one time white, at another black, at one time warm, at another cold, at one time good, at another bad." The qualities do not change, but the substance in changing, passes from one quality to its contrary. (The difference between change of quality, or alteration, and the other types of change which substances can undergo, is discussed in the chapter on CHANGE.)

Aristotle suggests another mark of distinction between substance and quality. One substance, he says, never stands to another as its contrary, in the way in which qualities are con-

trary to one another, like hot and cold, white and black, good and bad. A quality may have a correlative as well as a contrary, e.g., if knowledge is a quality of mind, the object known is its correlative, whereas ignorance of the object is the contrary of knowledge. In some cases, the contrary qualities may be the extremes or limits of a continuous series of intermediates, e.g., white and black with all the intermediate greys. In some cases, as with knowledge and ignorance, the contrary qualities have no intermediates. (Contrariety and correlation, most frequently exemplified by qualities, are considered in the chapter on OPPOSITION.)

Still another mark of distinction between substance and quality, according to Aristotle, is that qualities *do* and substances *do not* admit of variation in degree. "One man cannot be more man than another," he writes, "as that which is white may be more or less white than some other white object. . . . The same quality, moreover, is said to subsist in a thing in varying degrees at different times. A white body is said to be whiter at one time than it was before, or a warm body is said to be warmer or less warm than at some other time."

This observation raises a number of questions. Does variation in the degree of a quality from time to time imply that qualities themselves undergo change, just as substances undergo change in quality? Do they remain one and the same in kind while varying in degree? Is this change which qualities undergo as they increase or decrease in intensity, a change in quantity? Furthermore, does the fact that something white can become more or less white, mean that a quality can have a certain quantity even as a body can? Aquinas suggests an answer by distinguishing between what he calls the "dimensive quantity" of bodies and the "virtual quantity" of qualities. Virtual quantity is the degree or intensity which non-quantitative attributes may possess—such personal qualities as virtues and habits, or such corporeal qualities as colors and textures.

But this still seems to leave a very difficult question to be answered. How can qualities have the attribute of quantity without becoming substances? On the principle which both Aristotle and Aquinas accept—that accidents exist only in substances—how can one kind of

accident (quantity) exist in another (quality)? The view which William James holds, namely, that variation in intensity creates differences in color as much as variation in hue, would solve the problem, or rather it would dismiss the problem as not genuine by denying Aristotle's thesis that a color can remain the same while varying in degree.

However handled, the problem is not peculiar to qualities. Actions and passions, Aristotle points out, also vary in degree. Nor are qualities distinguished from everything else in the world by having contraries. Correlatives can also have contraries, as can actions and passions. Furthermore, not all qualities have contraries. Not all admit of variation in degree. Shape, like triangular or square, which Aristotle regards as a kind of quality, cannot vary in this way. The square thing cannot become more or less square. In view of all this, Aristotle concludes that there is one characteristic alone which differentiates quality not only from substance, but also from everything else. Quality is the basis for saying that things are like or unlike, similar or dissimilar, as quantity is the basis for saying that things are equal or unequal.

Other contrasts between quality and quantity, especially those bearing on the reduction of quality to quantity, are discussed in the chapter on QUANTITY. Here it may be illuminating to apply the foregoing distinction between quality and quantity to shapes or figures. Shape or figure is a curious mixture of quality and quantity. It is a quantified quality or a qualified quantity or, as Aquinas says, "a quality about quantity, since the nature of shape consists in fixing the bounds of magnitude." This seems to be evident in the fact that shapes, like quantities, do not admit of variation in degree. But it may also be seen in the fact that Euclid deals quite separately with problems concerning the *equality* of triangles and problems concerning their *similarity*.

EXCEPT FOR THE QUESTION of whether qualities subsist by themselves or are the attributes of substances, most of the problems of quality seem to concern its distinction from or relation to quantity. As we have seen, the question of the degree or amount of a quality involves the notion of quantity. Even more explicitly a

problem of how qualities and quantities are related, is the question of the order of these two attributes. Can it be said that quantities are the more fundamental attributes of things and that they somehow precede or underlie qualities? Is it the reverse? Or are qualities prior in certain respects and quantities in other respects?

Aristotle's theory of the elements seems to give absolute primacy to quality in the realm of material things. The four elements of matter are characterized by combinations of two pairs of contrary qualities, the hot and the cold, the dry and the moist. On the other hand, the atomic theory of Lucretius appears to make quantities, such as size and weight, the primary properties of matter. Newton's enumeration of what he calls "the universal qualities of all bodies whatsoever," including, of course, their "least particles," lists "extension, hardness, impenetrability, mobility, and inertia." As indicated in the chapter on QUANTITY, the very reason Newton gives for calling these qualities "universal" would seem to justify calling them "quantities" rather than qualities. In any case, Newton's view, like that of the ancient atomists, seems to be opposed to the theory of the *elementary* and *contrary* qualities.

But Aristotle himself also appears to hold a view which makes quantity prior to quality. Considering the way in which the quality *white* is in a body, he says that it is in the body in virtue of the body's extended surface. If surface or extension is interpreted as a physical quantity, then it would seem to follow that this quantity underlies a body's possession of visible and perhaps other qualities. Aquinas, for example, says that "quantity is the proximate subject of the qualities that cause alteration, as surface is of color," and, again, that "quantity is in substance before sensible qualities are."

This last statement can be interpreted to mean that quantity is *universally* prior to quality among the attributes of substance. Or it can be understood to mean that quantity is prior only to *sensible* qualities and then only among the physical attributes of bodies. Which interpretation is chosen depends in part on whether *all* qualities are sensible.

It would seem that all qualities are not sensible, according to Aristotle and Aquinas, and therefore quantity is not prior to every kind of

quality among the accidents of substance. Natural qualities, Aquinas writes, "may be in the intellectual part or in the body and its powers." Certainly the qualities inherent in the intellectual part of man's nature are not sensible; nor are the first two of the four species of quality which both Aristotle and Aquinas enumerate.

In their enumeration, human qualities—the habits or dispositions of a man, such as knowledge and virtue, or beauty and health—are the first sort. The powers or inborn capacities whereby men and other animals act to develop their natures are a second type of quality; *e.g.*, the power of sensitivity in animals, the power of rationality in men, are qualities proper to these species and are, therefore, sometimes called "properties." This second type of quality does not seem to be restricted to living things. Inanimate bodies also have, among their properties, certain fundamental powers of action or reaction. The third and fourth types of quality differ from the first two in that both are sensible, *i.e.*, capable of affecting the senses directly and, therefore, sometimes called "affective qualities." Of these, the third type—shape or figure—has already been discussed. The fourth type—colors, sounds, textures, odors, tastes, and such thermal qualities as hot and cold—are, more than shape or figure, regarded as the principal affective or sensible qualities.

The fact that Aristotle regards certain qualities, such as hot and cold, or hard and soft, as being dispositions or powers as well as being affective qualities, need not invalidate his fourfold classification. His classification of the same attribute under two distinct species of quality seems to imply that it can be considered from two points of view. The elementary qualities, for example, are affective or sensible qualities but they are also the active qualities or powers—the properties—of the elements.

In view of this classification of qualities, it does not seem to be the case that quantities are prior to *all* the qualitative attributes of substance. On the conception of living things as composite of soul and body, the qualities which are vital powers are usually regarded as properties which the thing has in virtue of having a soul. They are certainly not founded upon the quantitative attributes of the organism's body.

The moral and spiritual qualities of men seem to afford another example of qualities either prior to, or at least independent of, quantities. Even in the case of inanimate bodies, it may be that certain fundamental properties or powers are essentially qualitative rather than quantitative. The proposition that in substances, quantities are prior to qualities—or that qualities inhere in substances in virtue of their quantities—may apply only to sensible qualities, as, for example, colors in relation to surfaces.

ONE OF THE GREAT ISSUES in the tradition of western thought concerns our perception or knowledge of qualities. If certain characteristics which are not directly sensible are to be called "qualities," then the problem of how we know such qualities does not differ from the problem of how we know anything else that cannot be apprehended by our senses. We may, for example, be able to infer such qualities as habits or powers from the sensible evidences of a thing's behavior, even as in turn we infer the thing's nature or essence from its proper qualities or properties. With regard to sensible qualities, the problem does not seem to be *how* we know them—for the fact that they are sensible means that they are knowable by the senses. The question is rather one of the mode of existence—the objectivity or subjectivity—of the qualities sensed.

Locke's famous distinction between primary and secondary qualities states the problem. It is preceded by his distinction between the qualities of things and the ideas in our minds. "A snow-ball," he writes, has "the power to produce in us the idea of white, cold, and round. The powers to produce those ideas in us, as they are in the snow-ball, I call qualities; and as they are sensations or perceptions in our understandings, I call them ideas; which ideas, if I speak of them sometimes as in the things themselves, I would be understood to mean those qualities in the objects which produce them in us."

The primary qualities of bodies are those which are utterly inseparable from body—such as "sense constantly finds in every particle of matter which has bulk enough to be perceived, and the mind finds inseparable from every par-

ticle of matter, though less than to make itself singly perceived by our senses." Locke's enumeration of these "original or primary qualities of body, which we may observe to produce simple ideas in us, *viz.*, solidity, extension, figure, motion or rest, and number," closely resembles Newton's list of the universal qualities of perceptible bodies and of their "least particles" or atoms.

In contrast, the secondary qualities, such as colors, sounds, tastes, etc., are "nothing in the objects themselves, but powers to produce various sensations in us by their primary qualities, *i.e.*, by the bulk, figure, texture, and motion of their insensible parts. . . . From whence," Locke declares, "I think it is easy to draw this observation, that the ideas of primary qualities of bodies, are resemblances of them, and their patterns do really exist in the bodies themselves, but the ideas produced in us by these secondary qualities, have no resemblance of them at all. There is nothing like our ideas existing in the bodies themselves. They are in the bodies we denominate from them, only a power to produce those sensations in us: what is sweet, blue, or warm, in idea, is but the certain bulk, figure and motion of the insensible parts in the bodies which we call so."

Locke thinks the sensation of pain confirms this insight. As the piece of steel which by its corporeal properties has the power to produce pain in us, does not itself have the quality of pain, so it does not have anything corresponding to the ideas of blueness or coldness which it produces in us, except the power to produce these ideas through the action of its primary qualities on our senses. Yet Locke maintains that all our simple ideas of quality—not only of primary, but also of secondary qualities—"agree with the reality of things." By *agreement* he does not mean *resemblance* in the sense of copying; and therefore he thinks he can, without inconsistency, deny any *resemblance* between sensations of color or taste and the secondary qualities of bodies, while saying that "if sugar produces in us the ideas we call whiteness and sweetness, we are sure there is a power in sugar to produce those ideas in our minds, or else they could not have been produced by it."

Locke's point, however, is sometimes given exactly the opposite implication. Earlier think-

ers who do not speak of primary and secondary qualities attribute to bodies only the characteristics which Locke calls primary, and give what he calls secondary qualities no reality at all, that is, no existence outside the mind. The secondary qualities are not qualities of things, but of sensations or images. Descartes, for example, says that nothing belongs "to the nature or essence of body except . . . length, breadth and depth, admitting of various shapes and various motions. . . . On the other hand, colors, odors, savours, and the rest of such things are merely sensations existing in my thought, and differing no less from bodies than pain differs from the shape and motion of the instrument which inflicts it."

Hobbes similarly regards the various sensible qualities as feelings in us—the seemings or fancies of sense. All these "qualities called sensible are in the object that causes them, nothing but so many several motions of the matter. . . . The object is one thing, the fancy is another." One type of "absurd assertion," in the opinion of Hobbes, consists in giving "the names of the accidents of bodies without us, to the accidents of our own bodies, as they do that say, *the color is in the body, the sound is in the ear*, etc."

The attributes or accidents which Descartes and Hobbes assign to bodies seem to be quantities rather than qualities. Accordingly, whereas Locke attributes both primary and secondary *qualities* to bodies, Hobbes and Descartes seem to be saying that bodies differ from one another only quantitatively, and that qualities or qualitative differences occur only in the realm of sense or thought. Expounding the atomism of Democritus and Epicurus, Lucretius appears to make precisely this point when he says that the first-beginnings or atoms are characterized only by size, weight, shape, and motion. "The bodies of matter," he writes, "have no color at all." They are bereft not only of color; "they are also sundered altogether from warmth and cold, and fiery heat, and are carried along barren of sound and devoid of taste." These qualities, caused by the blows of the atoms upon the sense-organs of animals, are the qualities of sensations, not of things.

THE CRITICISM OF THIS THEORY—whether in the formulation of Locke or in that of Descartes,

Hobbes, and Lucretius—seems itself to take two forms. Aristotle, for example, criticizes Democritus and the atomists for treating perceptible qualities differently from perceptible quantities. According to his own theory of the objects of sense, some, like colors, sounds, odors, flavors—which Locke calls “secondary qualities” and the others simply “qualities”—are the proper objects of the special senses, such as sight, hearing, smell, taste. In contrast to these “proper sensibles,” each exclusively perceived by one and only one sense, there are the “common sensibles,” such as size and shape, number, movement and rest, which can be perceived commonly by several senses, *e.g.*, shape is visible and tangible, motion is visible and audible. Such sensible attributes of body, which Locke calls “primary qualities,” Aristotle, no less than Hobbes or Lucretius, regards as quantities, not qualities. Reporting his view, Aquinas writes that “the common sensibles are all reducible to quantity.”

Aristotle’s critical point seems to be that the atomists “reduce the proper to the common sensibles, as Democritus does with white and black; for he asserts that the latter is a mode of the rough and the former a mode of the smooth, while he reduces savours to the atomic figures.” The atomists sometimes make the opposite error of representing “all objects of sense as objects of touch.” But in either case they have no ground, in Aristotle’s opinion, for giving to certain sensible attributes—whether these be tangible qualities or the commonly sensible quantities—an objective reality they deny to other sensible traits, like colors, sounds, and odors.

Aristotle’s theory of sensation and the sensible is discussed more fully in the chapter on *SENSE*. According to it, the qualities, no less than the quantities, perceptible by sense have real or actual existence as the attributes of bodies. On this score Aristotle does not differentiate between qualities (the proper sensibles) and quantities (the common sensibles). Just as a body actually has the shape we perceive it to have, so it actually has the color we perceive it to have, on the supposition, of course, that our perception is accurate in both cases. If the senses are fallible at all, we are less prone to make errors, Aristotle thinks, in the field of the

proper than of the common sensibles, *e.g.*, the stick in water which looks bent to the eye feels straight to the hand.

PRECISELY THE OPPOSITE direction seems to be taken by Berkeley and Hume. Where Aristotle criticizes the atomists for treating quantities (or common sensibles) as objective, and qualities (or proper sensibles) as subjective, Berkeley criticizes Locke for treating primary and secondary qualities differently. Where Aristotle’s own theory assigns the same reality to all objects of sense, granting them an actuality apart from perception, Berkeley makes the actuality of the primary as well as the secondary qualities dependent upon their being perceived.

“Some there are,” writes Berkeley, “who make a distinction betwixt *primary* and *secondary* qualities. By the former they mean extension, figure, motion, rest, solidity or impenetrability and number; by the latter they denote all other sensible qualities, as colors, sounds, tastes and so forth. The ideas we have of these they acknowledge not to be the resemblances of anything existing without the mind or unperceived, but they will have our ideas of the primary qualities to be patterns or images of things which exist without the mind, in an unthinking substance which they call Matter.”

Berkeley then argues that the so-called primary qualities are incapable of being separated, in reality or thought, from the secondary qualities, and that, therefore, the one like the other exists only in the mind. “In short, let anyone consider those arguments which are thought manifestly to prove that colors and tastes exist only in the mind, and he shall find they may with equal force be brought to prove the same thing of extension, figure, and motion.” His own arguments, he thinks, “plainly show it to be impossible that any color or extension at all, or other sensible quality whatsoever, should exist in any unthinking subject without the mind, or in truth, that there should be any such thing as an outward object.”

Hume professes to adopt Berkeley’s reasoning. “It is universally allowed by modern enquirers,” he writes, “that all the sensible qualities of objects, such as hard, soft, hot, cold, white, black, etc., are merely secondary, and

exist not in the objects themselves, but are perceptions of the mind, without any external archetype or model which they represent. If this be allowed, with regard to secondary qualities, it must also follow with regard to the supposed primary qualities of extension and solidity.... The idea of extension is entirely acquired from the senses of sight and feeling; and if all the qualities, perceived by the senses, be in the mind, not in the object, the same conclusion must reach the idea of extension. . . . Nothing can save us from this conclusion, but the asserting that the ideas of those primary qualities are attained by *Abstraction*, an opinion, which, if

we examine it accurately, we shall find to be unintelligible, and even absurd."

One fundamental point about sensible qualities may, however, remain unaffected by this long and many-sided controversy. No one denies that sensible qualities are the elements of human experience. That they are "the original, innate, or *a priori* properties of our subjective nature," James declares, must be allowed by "all schools (however they otherwise differ). . . . This is so on either of the two hypotheses we may make concerning the relation of the feelings to the realities at whose touch they become alive."

OUTLINE OF TOPICS

PAGE

- | | |
|--|-----|
| 1. The nature and existence of qualities: the relation of quality to substance or matter; the transcendental categories of quality | 521 |
| 2. The kinds of quality | 522 |
| 2a. Sensible and nonsensible qualities: habits, dispositions, powers or capacities, and affective qualities | |
| 2b. Primary and secondary qualities: the related distinction of proper and common sensibles | |
| 3. Quality and quantity | |
| 3a. The distinction between quality and quantity: its relation to the distinction between secondary and primary qualities | |
| 3b. Shape or figure as qualified quantity | 523 |
| 3c. The degrees or amounts of a quality: intensity and extensity; the quantitative conditions of variation in quality | |
| 3d. The priority of quality or quantity in relation to form, matter, or substance | |
| 4. The relation of qualities to one another | 524 |
| 4a. Qualities which imply correlatives | |
| 4b. The contrariety of qualities: with or without intermediate degrees | |
| 4c. The similarity of things with respect to quality: likeness and unlikeness in quality | |
| 5. Change of quality: the analysis of alteration | |
| 6. Qualities as objects of knowledge | |
| 6a. Quality in relation to definition or abstraction | |
| 6b. The perception of qualities | 525 |
| 6c. The objectivity of sense-qualities: the comparative objectivity of primary and secondary qualities | |

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER *Iliad*, BK II [265 283] 12d the number 4 is the number of the volume in the set, the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS. When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES *Psychology*, 116a 119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example, in 7 PLATO *Symposium* 163b 164c the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

AUTHOR'S DIVISIONS. One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference line numbers, in brackets, are given in certain cases. e.g., *Iliad*, BK II [265 283] 12d.

BIBLE REFERENCES. The references are to book, chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows, e.g., OLD TESTAMENT *Newman* 7 45 (D) II Esdras, 7 46.

SYMBOLS. The abbreviation 'esp' calls the reader's attention to one or more especially relevant parts of a whole reference. *passim* signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style. For general guidance in the use of *The Great Ideas*, consult the Preface.

1. The nature and existence of qualities: the relation of quality to substance or matter; the transcendental categories of quality

Chapter 76: QUANTITY

INTRODUCTION

AS indicated in the chapter on QUALITY, the traditional consideration of that fundamental notion involves questions concerning the relation of quality and quantity and the priority of one or the other in the nature of things. According to one theory of the elements, difference in quality rather than in quantity seems to be the defining characteristic. Certain kinds of qualities, it is thought, inhere in substances directly and without being based upon their quantitative aspects. But it is seldom if ever suggested that quality takes universal precedence over quantity.

In the tradition of western thought, the opposite view—that quantities are primary—seems to occur with some frequency, at least so far as the realm of material things is concerned. It is held that bodies have only quantitative attributes. Such sensible qualities as colors, odors, tastes, textures are thought to have no reality apart from experience; or, as it is sometimes put, red and blue, hot and cold, sweet and sour are the qualities of sensations, not of things.

Those who think that bodies can exist without being perceived, also tend to think that bodies can exist totally bereft of qualities, but never without the dimensions of quantity. The notions of matter and quantity seem to be inseparably associated. For matter to exist without existing in some quantity seems to be as inconceivable as for experience to exist without qualitative diversity. "As if there could be matter," says Hobbes, "that had not some determined quantity, when quantity is nothing else but determination of matter; that is to say, of body, by which we say that one body is greater or less than another by thus or thus much."

The use of the word "quality" where quantity appears to be meant only slightly obscures

this point. Newton refers to "extension, hardness, impenetrability, mobility, and inertia" as "the qualities of bodies" which "are to be esteemed the universal qualities of all bodies whatsoever." Following him, Locke calls our simple ideas of "solidity, extension, figure, motion or rest, and number" ideas of "the original or primary qualities of bodies," and says that even if bodies are divided "till their parts become insensible, they must retain still each of them all those qualities. For division . . . can never take away either solidity, extension, figure, or mobility from any body, but only makes two or more distinct separate masses of matter, of that which was one before."

Though Locke uses the word "quality" for those attributes which belong to bodies even when they are not sensed or are not even sensible, he also appears to recognize that number, extension, and figure are, as the traditional objects of the mathematical sciences, traditionally regarded as quantities rather than qualities. "It has been generally taken for granted," he writes, "that mathematics alone are capable of demonstrative certainty; but to have such an agreement or disagreement as may intuitively be perceived, being, as I imagine, not the privilege of the ideas of number, extension, and figure alone, it may possibly be the want of due method and application in us . . . that demonstration has been thought to have so little to do in other parts of knowledge." Yet, he adds, "in other simple ideas, whose modes and differences are made and counted by degrees, and not quantity, we have not so nice and accurate a distinction of their differences as to perceive, or find ways to measure, their just equality."

Newton also gives some indication that his "universal qualities" are quantities. He restricts them to attributes "which admit neither intensification nor remission of degrees." One dif-

ference between quantity and quality, according to an ancient opinion, is that qualities are subject to variation in degree, quantities not. One thing may be white or hot to a greater or less degree than another, Aristotle observes, but "one thing cannot be two cubits long in a greater degree than another. Similarly with regard to number: what is 'three' is not more truly three than what is 'five' is five . . . Nor is there any other kind of quantity, of all that have been mentioned, with regard to which variation in degree can be predicated."

GRANTED THAT WHAT Newton and Locke call "qualities" are not qualities, except in the sense in which the word "quality" means attribute, difficult questions remain concerning their enumeration of the *universal* or *primary* attributes of bodies. Do extension, hardness, impenetrability, motion and rest, figure and number constitute an exhaustive enumeration? Are these *all* the corporeal quantities, or only the basic ones from which others can be derived? Are they all of the same kind and, among them, are some more fundamental than others?

Descartes, for example, seems to make extension the one primary attribute of bodies. "I observed," he writes, "that nothing at all belonged to the nature or essence of bodies, except that it was a thing with length, breadth, and depth, admitting of various shapes and various motions. I found also that its shape and motions were only modes, which no power could make to exist apart from it . . . Finally, I saw that gravity, hardness, the power of heating, of attracting, and of purging, and all other qualities which we experience in bodies, consisted solely in motion or its absence, and in the configuration and situation of their parts."

With motion and figure modes of extension, and all the other properties of bodies the result of their motions or configurations, the three dimensions of extension (or spatial magnitude) become almost identical with body itself. Considering the statement *body possesses extension*, Descartes points out that, though "the meaning of *extension* is not identical with that of *body*, yet we do not construct two distinct ideas in our imagination, one of body, the other of extension, but merely a single image of extended body; and from the point of view of the thing

it is exactly as if I had said: *body is extended*, or better, *the extended is extended*."

But, Descartes adds, when we consider the expression *extension is not body*, "the meaning of the term *extension* becomes otherwise than as above. When we give it this meaning there is no special idea corresponding to it in the imagination." It becomes a purely abstract entity, which may properly be the object of the geometer's consideration; but then it should be treated as an abstraction and not as if it had independent reality.

Aquinas also distinguishes between physical and mathematical quantities, or the quantities which inhere in bodies and the quantities abstracted therefrom. "Quantities, such as number, dimension, and figure, which are the terminations of quantity, can be considered apart from sensible qualities, and this is to abstract them from sensible matter. But they cannot be considered without understanding the substance which is subject to quantity"—that is, corporeal or material substance. Like a body, a mathematical solid has three dimensions, but, as Aquinas points out, lacking matter, this three-dimensional object does not occupy space or fill a place. The three spatial dimensions are not for him, however, the only primary quantities of either the physical or the mathematical body. Number and figure are as fundamental.

Still another enumeration of corporeal quantities is given by Lucretius in his description of the properties of atoms. According to him, atoms vary in size, weight, and shape. Each of these attributes is a distinct quantity, not reducible to the others. In addition, atoms have the property which Newton calls "impenetrability" and Locke "solidity." But whereas atoms may be unequal in size and weight, and different in shape or configuration, they are all equal in their solidity, being absolutely indivisible through lack of void or pores.

THE DISTINCTION BETWEEN mathematical and physical quantity and the enumeration or ordering of diverse quantities seem to require the consideration of two prior questions. What is the nature of quantity? What are the kinds or modes of quantity?

Terms like quantity and quality do not appear to be susceptible of definition. Quantity is,

perhaps, *the* fundamental notion in the mathematical sciences, yet neither it nor such terms as magnitude, figure, and number are defined in the great books of geometry or arithmetic. In Aristotle's theory of the categories as the highest genera, such terms as substance, quantity, quality, and relation are strictly indefinable, if to define a term is to give its genus and differentia.

With quite a different theory of the categories, Kant also treats them as indefinable. As indicated in the chapter on QUALITY, they are for him the transcendental concepts of the understanding. He uses such terms as quantity, quality, and relation, with modality as a co-ordinate fourth, to represent the four major groupings of the categories. In his table of the categories, Kant's treatment of quantity, under which he lists the concepts of unity, plurality, and totality, parallels the treatment of quantity in his table of judgments, according to which judgments are classified as universal, particular, and singular. All these considerations of quantity belong to what Kant calls his "transcendental logic." So far as Kant considers quantity in its mathematical or physical (rather than logical) significance, he discusses it in connection with the transcendental forms of space and time which provide, according to him, the *a priori* foundations of geometry and arithmetic—the sciences of magnitude and number. But in none of these connections are quantity and its principal modes, magnitude and number, defined.

Though indefinable, quantity can, according to Aristotle, be characterized by certain distinctive marks. As we have already observed, where qualities admit of variation in degree, quantities do not. With few exceptions, each quality has a contrary, whereas definite quantities such as an extent or a number are not opposed by contrary quantities. Aristotle considers the possibility that such apparently quantitative terms as 'large' and 'small' may also appear to be contrary to one another, as hot is to cold, or white is to black. But, he argues, these terms represent quantities only relatively, not absolutely. When things are compared with respect to size, one may be judged to be both larger and smaller than others, but the sizes of each of two things unequal in size are not contrary to one another.

These two characteristics (lack of contrariety and of variation in degree) do not, however, satisfy Aristotle's search for a distinctive mark of quantity. They apply to substances, such as tree or man, as well as to figures and numbers. This fact could have some bearing on the issue whether the objects of mathematics have a separate existence comparable to that of substances, but in Aristotle's view at least, quantities are not substances. Physical quantities are the attributes of bodies; the objects of mathematics consist of quantities abstracted from sensible matter.

Conceiving quantity as one of the attributes of substance, Aristotle says that "the most distinctive mark of quantity is equality and inequality." Only when things are compared quantitatively can they be said to be equal or unequal; and, conversely, in whatever respect things are said to be equal or unequal, in that respect they are determined in quantity.

"How far is it true," Plotinus asks, "that equality and inequality are characteristic of quantity?" It is significant, he thinks, that triangles and other figures are said to be similar as well as equal. "It may, of course, be the case that the term 'similarity' has a different sense here from that understood in reference to quality"; or another alternative, Plotinus adds, may be that "similarity is predicable of quantity only insofar as quantity possesses [qualitative] differences." In any case, comparison, whether in terms of equality or likeness, seems to generate the relationships fundamental to the mathematical treatment of quantities.

Euclid does not define magnitude in itself, but only the relation of magnitudes to one another. The first four definitions in the fifth book of his *Elements* illustrate this. "1. A magnitude is a *part* of a magnitude, the less of the greater, when it measures the greater. 2. The greater is a *multiple* of the less when it is measured by the less. 3. A *ratio* is a sort of relation in respect of size between two magnitudes of the same kind. 4. Magnitudes are said to *have a ratio* to one another, which are capable, when multiplied, of exceeding one another."

Archimedes also states his understanding of the distinction between kinds of magnitudes—without defining these kinds—by reference to their comparability. Assuming that any given

magnitude can, by being multiplied, exceed any other magnitude of the same kind, he is able to know that magnitudes are of the same kind if, by being multiplied, they can exceed one another. It follows that an indivisible point and a finite or divisible magnitude, such as a line, are not of the same kind, for they cannot have a ratio to one another. For the same reason, the length of a line, the area of a plane, and the volume of a solid are not magnitudes of the same kind. Since they bear no ratio to one another, they are quantitatively incomparable.

THE EMPHASIS UPON ratios has some significance for a controversial point in the definition of the subject matter of mathematics. In the tradition of the great books, mathematicians and philosophers seem to agree that arithmetic and geometry have as their objects the two principal species of quantity—number and magnitude. This is the opinion of Euclid, Nicomachus, Descartes, and Galileo; it is the opinion of Plato, Aristotle, Aquinas, Bacon, Hume, and Kant. But writers like Russell and Whitehead, who reflect developments in mathematics since the 19th century, reject the traditional opinion as unduly narrowing the scope of mathematics.

To give adequate expression to the universality of mathematics, they sometimes propose that it should be conceived as the science not merely of quantity, but of relations and order. In view of the fact that the great books of mathematics deal with quantities largely in terms of their relationship or order to one another, the broader conception seems to fit the older tradition as well as more recent developments. Whether there is a genuine issue here concerning the definition of mathematical subject matter may depend, therefore, on whether the fundamental terms which generate the systems of relationship and order are or are not essentially quantitative. To this question the traditional answer seems to be that the mathematician studies not relations of any sort, but the relation of quantities.

The problem of the kinds of quantity seems to appeal for solution to the principle of commensurability. For example, Galileo's observation that finite and infinite quantities cannot be compared in any way, implies their utter

diversity. But he goes further and says that "the attributes 'larger,' 'smaller,' and 'equal' have no place either in comparing infinite quantities with each other or in comparing infinite quantities with finite quantities." If the notion of quantity entails the possibility of equality or inequality between two quantities *of the same kind*, then either infinite quantities are not quantities, or each infinite quantity belongs to a kind of its own.

The principle of incommensurability seems to be applied by mathematicians to distinguish quantities which are different species of the same generic kind. For example, the one-dimensional, two-dimensional, and three-dimensional quantities of a line, a plane, and a solid, are incommensurable *magnitudes*. The number of days in a year and the number of years in infinite or endless time are incommensurable *multitudes*.

The distinction between magnitude and multitude (or number) as two modes of quantity appears to be based upon another principle, that of continuity and discontinuity. Yet the question can be raised whether magnitudes are commensurable with numbers, at least to the extent of being measured by numbers. It may be necessary, however, to postpone answering it until we have examined the fundamental difference between magnitude and multitude as generic kinds of quantity.

What if magnitude and multitude, or continuous and discontinuous quantity, do not divide quantity into its ultimate kinds? Aquinas, for example, proposes that the two basic kinds are dimensive and virtual quantity. "There is quantity of *bulk* or dimensive quantity," he writes, "which is to be found only in corporeal things, and has, therefore, no place in God. There is also quantity of *virtue*, which is measured according to the perfection of some nature or form." It is in the latter sense, according to Aquinas, that Augustine writes: "In things which are great, but not in bulk, to be greater is to be better."

Just as dimensive quantities can be incommensurable with one another, so with respect to virtual quantities, God's infinite perfection makes him incommensurable with finite creatures. But a dimensive quantity cannot be either commensurable or incommensurable with

a virtual quantity. The standard of measurement by which dimensive quantities are compared, and the standard by which virtual quantities are ordered, represent utterly diverse principles of commensurability. Euclid's statement that "those magnitudes are said to be commensurable which are measured by the same measure, and those incommensurable which cannot have a common measure," cannot be extended to cover dimensive and virtual quantities, for the very meaning of "measure" changes when we turn from the dimensions of a body to the perfections of a being.

The distinction which Aquinas makes between dimensive and virtual magnitudes has its parallel in the distinction he makes between two kinds of number, for both depend on the difference between *material* and *formal* quantity. "Division is twofold," he writes. "One is material, and is division of the continuous; from this results number, which is a species of quantity. Number in this sense is found only in material things which have quantity. The other kind of division is formal, and is effected by opposite or diverse forms; and this kind of division results in a multitude, which does not belong to a genus, but is transcendental in the sense in which being is divided by one and many. Only this kind of multitude is found in immaterial things." According to the example suggested in the context, such is the multitude which is the number of persons in the Trinity.

THE MATERIAL quantities of physics and mathematics seem to fall under the two main heads of magnitude and multitude. "Quantity is either discrete or continuous," writes Aristotle. "Instances of discrete quantities are number and speech; of continuous, lines, surfaces, solids, and, besides these, time and place." Nicomachus explains the two kinds of quantity by examples. "The unified and continuous," he says, is exemplified by "an animal, the universe, a tree, and the like, which are properly and peculiarly called 'magnitudes' "; to illustrate the discontinuous, he points to "heaps of things, which are called 'multitudes,' a flock, for instance, a people, a chorus, and the like."

The principle of this distinction appears to be the possession or lack of a common boundary. To take Aristotle's example of speech as a

quantity, the letters of a written word or the syllables of vocal utterance comprise a multitude rather than a continuum or magnitude "because there is no common boundary at which the syllables join, each being separate and distinct from the rest." The continuity of magnitudes can be readily seen, according to Aristotle, in the possibility of finding a common boundary at which the parts of a line join or make contact. "In the case of a line," he says, "this common boundary is the point; in the case of a plane, it is the line. . . . Similarly, you can find a common boundary in the case of the parts of a solid, namely, either a line or a plane."

Accepting the principle of the distinction, Plotinus insists that "number and magnitude are to be regarded as the only true quantities." All others, like space and time, or motion, are quantities only in a relative sense, that is, insofar as they can be measured by number or involve magnitude. Galileo raises another sort of difficulty. The Aristotelian conception of magnitudes as continuous quantities implies their infinite divisibility. This means, in his terms, that "every magnitude is divisible into magnitudes" and that "it is impossible for anything continuous to be composed of indivisible parts." Galileo acknowledges the objections to "building up continuous quantities out of indivisible quantities" on the ground that "the addition of one indivisible to another cannot produce a divisible, for if this were so it would render the indivisible divisible." Suppose a line to comprise an odd number of indivisible points. Since such a line can, in principle, be cut into two equal parts, we are required to do the impossible, namely, "to cut the indivisible which lies exactly in the middle of the line."

To this and other objections which seem to him of the same type, Galileo replies that "a divisible magnitude cannot be constructed out of two or ten or a hundred or a thousand indivisibles, but requires an infinite number of them. . . . I am willing," he says, "to grant to the Peripatetics the truth of their opinion that a continuous quantity is divisible only into parts which are still further divisible, so that however far the division and subdivision be continued, no end will be reached; but I am not so certain that they will concede to me that none of these divisions of theirs can be a final

one, as is surely the fact, because there always remains 'another'; the final and ultimate division is rather one which resolves a continuous quantity into an infinite number of indivisible quantities."

The question remains whether these indivisible units, an infinite number of which constitute the continuity of a finite magnitude, can properly be called quantities. At least they are not magnitudes, as is indicated by Euclid's definition of a point as "that which has no part," or by Nicomachus' statement that "the point is the beginning of dimension, but is not itself a dimension." If, in addition to having position, a point had size or extent, a finite line could not contain an infinite number of points. This problem of infinite and infinitesimal quantities is more fully discussed in the chapter on INFINITY.

WITHIN EACH OF THE two main divisions of quantity—magnitude and number—further sub-divisions into kinds are made. Relations of equality and inequality, or proportions of these ratios, may occur between quantities different in kind—different plane figures, for example. But the great books of mathematics indicate other problems in the study of quantity than those concerned with the ratios and proportions of quantities. The classification of lines and figures results in the discovery of the properties which belong to each type. Possessing the same properties, all lines or figures of a certain type are similar in kind, not equal in quantity. In addition to developing the properties of such straight lines as perpendiculars and parallels, or such curved lines as circles and ellipses, parabolas and hyperbolas, the geometer defines the different types of relationship in which straight lines can stand to curves, *e.g.*, tangents, secants, asymptotes.

As there are types of lines and figures, both plane and solid, so there are types of numbers. Euclid and Nicomachus divide the odd numbers into the prime and the composite—into those which are divisible only by themselves and unity, such as 5 and 7, and those which have other factors, such as 9 and 15. The composite are further differentiated into the variety which is simply secondary and composite and "the variety which, in itself, is secondary and composite, but relatively is prime and incom-

posite." To illustrate the latter, Nicomachus asks us to compare 9 with 25. "Each in itself," he writes, "is secondary and composite, but relatively to each other they have only unity as a common measure, and no factors in them have the same denominator, for the third part in the former does not exist in the latter nor is the fifth part in the latter found in the former."

The even numbers are divided by Nicomachus into the even times even (numbers like 64 which can be divided into equal halves, and their halves can again be divided into equal halves, and so on until division must stop); the even-times-odd (numbers like 6, 10, 14, 18 which can be divided into equal halves, but whose halves cannot be divided again into equal halves); and the odd-times-even (numbers like 24, 28, 40 which can be divided into equal parts, whose parts also can be so divided, and perhaps again these parts, but which cannot be divided in this way as far as unity). By another principle of classification, the even numbers fall into the superabundant, the deficient, and the perfect. The factors which produce superabundant or deficient numbers, when added together, amount to more or less than the number itself; but a number is perfect, Nicomachus writes, when, "comparing with itself the sum and combination of all the factors whose presence it will admit, it neither exceeds them in multitude nor is exceeded by them." It is "equal to its own parts"; as, for example, 6, "for 6 has the factors half, third, and sixth, 3, 2, and 1, respectively, and these added together make 6 and are equal to the original number." At the time of Nicomachus only four perfect numbers were known—6, 28, 496, 8128; since his day seven more have been discovered.

The further classification of numbers as linear, plane, and solid, and of plane numbers as triangular, square, pentagonal, etc., assigns properties to them according to their configurations. The analysis of figurate numbers by Nicomachus or Pascal represents one of the great bridges between arithmetic and geometry, of which the other, in the opposite direction, is the algebraic rendering of geometrical loci in Descartes' analytical geometry.

In either direction of the translation between arithmetic and geometry, discontinuous and continuous quantities seem to have certain

properties in common, at least by analogy. Euclid, for example, proposes numerical ratios as the test for the commensurability of magnitudes. "Commensurable magnitudes have to one another," he writes, "the ratio which a number has to a number." With the exception of infinite numbers, all numbers are commensurable and so provide the criterion for determining whether two magnitudes are or are not commensurable.

Introducing the notion of dimensionality into the discussion of figurate numbers, Nicomachus observes that "mathematical speculations are always to be interlocked and to be explained one by means of another." Though the dimensions by which linear, plane, and solid numbers are to be distinguished "are more closely related to magnitude . . . yet the germs of these ideas are taken over into arithmetic as the science which is the mother of geometry and more elementary than it." The translation does not seem to fail in any respect. The only non-dimensional number, unity, finds its geometrical analogue in the point, which has position without magnitude.

When diverse magnitudes are translated into numbers, the diversity of the magnitudes seems to be effaced by the fact that their numerical measures do not have a corresponding diversity. The numbers will appear to be commensurable though the magnitudes they measure are not, as magnitudes, comparable. As Descartes points out, it is necessary, therefore, to regard each order of magnitude as a distinct dimension.

"By dimension," Descartes writes, "I understand nothing but the mode and aspect according to which a subject is considered to be meas-

urable. Thus it is not merely the case that length, breadth, and depth are dimensions; but weight also is a dimension in terms of which the heaviness of objects is estimated. So, too, speed is a dimension of motion, and there are an infinite number of similar instances. For that very division of the whole into a number of parts of identical nature, whether it exist in the real order of things or be merely the work of the understanding, gives us exactly that dimension in terms of which we apply number to objects."

The theory of dimensions can be illustrated by the choice of clocks, rules, and balances as the fundamental instruments for the measurement of physical quantities. They represent the three dimensions in the fundamental equations of mechanics—time, distance, and mass.

Additional dimensions may be introduced in electricity or thermodynamics. In developing the theory of heat, Fourier, for example, enumerates five quantities which, in order to be numerically expressed, require five different kinds of units, "namely, the unit of length, the unit of time, that of temperature, that of weight, and finally the unit which serves to measure quantities of heat." To which he adds the remark that "every undetermined magnitude or constant has one *dimension* proper to itself, and that the terms of one and the same equation could not be compared, if they had not the same *exponent of dimension*."

A fuller discussion of the basic physical quantities, their definition, measurement, and their relation to one another, belongs to the chapter on MECHANICS. The consideration of time and space as quantities, or physical dimensions, occurs in the chapters devoted to those subjects.

OUTLINE OF TOPICS

	PAGE
1. The nature and existence of quantity: its relation to matter, substance, and body; the transcendental categories of quantity	535
1a. The relation between quantity and quality: reducibility of quality to quantity	536
1b. The relation of quantities: equality and proportion	
2. The kinds of quantity: continuous and discontinuous	537
3. The magnitudes of geometry: the relations of dimensionality	
3a. Straight lines: their length and their relations; angles, perpendiculars, parallels	

3 <i>b</i> . Curved lines: their kinds, number, and degree	538
(1) Circles	
(2) Ellipses	
(3) Parabolas	
(4) Hyperbolas	539
3 <i>c</i> . The relations of straight and curved lines: tangents, secants, asymptotes	
3 <i>d</i> . Surfaces	
(1) The measurement and transformation of areas	
(2) The relations of surfaces to lines and solids	540
3 <i>e</i> . Solids: regular and irregular	
(1) The determination of volume	
(2) The relations of solids: inscribed and circumscribed spheres; solids of revolution	
4. Discrete quantities: number and numbering	
4 <i>a</i> . The kinds of numbers: odd-even, square-triangular, prime-composite	
4 <i>b</i> . The relations of numbers to one another: multiples and fractions	541
4 <i>c</i> . The number series as a continuum	
5. Physical quantities	
5 <i>a</i> . Space: the matrix of figures and distances	
5 <i>b</i> . Time: the number of motion	
5 <i>c</i> . The quantity of motion: momentum, velocity, acceleration	542
5 <i>d</i> . Mass: its relation to weight	
5 <i>e</i> . Force: its measure and the measure of its effect	
6. The measurements of quantities: the relation of magnitudes and multitudes; the units of measurement	
6 <i>a</i> . Commensurable and incommensurable magnitudes	543
6 <i>b</i> . Mathematical procedures in measurement: superposition, congruence; ratio and proportion; parameters and coordinates	
6 <i>c</i> . Physical procedures in measurement: experiment and observation; clocks, rules, balances	
7. Infinite quantity: the actual infinite and the potentially infinite quantity; the mathematical and physical infinite of the great and the small	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER *Iliad*, BK II [265–283] 12d, the number 4 is the number of the volume in the set, the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES *Psychology*, 116a 119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example, in 7 PLATO *Symposium*, 163b 164c, the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

AUTHOR'S DIVISIONS One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference, line numbers, in brackets, are given in certain cases, e.g., *Iliad*, BK II [265–283] 12d.

BIBLE REFERENCES The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows, e.g., OLD TESTAMENT *Nehemiah*, 7:15–(D) II Esdras, 7:46.

SYMBOLS The abbreviation “esp” calls the reader’s attention to one or more especially relevant parts of a whole reference, “passim” signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style, for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 77: REASONING

INTRODUCTION

IN the tradition of western thought, certain verbal expressions have become shorthand for the fundamental ideas in the discussion of which they happen to be so often repeated. This may be due to the influence of the textbooks used in the schools, which copy one from another and hand down an easily recited jargon from generation to generation. In most cases the great books themselves are probably the original source, though they have usually suffered over-simplification or distortion when their insights are thus transmitted.

"Featherless biped" and "rational animal" are, for example, stock phrases to illustrate the idea that a definition consists of genus and differentia—the class to which man, in this instance, belongs and the attribute which differentiates him from other members of this class. Statements such as "the whole is greater than the part" or "two plus two equals four" similarly serve to represent axioms or at least statements which, whether or not they can be proved, are usually accepted as true without proof. In the field of reasoning, the familiar verbal landmark is "All men are mortal, Socrates is a man; therefore, Socrates is mortal." Even those who have never heard of syllogisms, or who are thoroughly innocent of the age-old controversies about the theory of the syllogism and the difference between deduction and induction, might offer this sequence of statements if, pressed to say what reasoning is, they tried to answer by giving an example.

The example, shopworn though it is and far from being the perfect paradigm, does convey certain insights into the nature of reasoning which are generally undisputed.

The word "therefore," which connects the third statement with the first two, signifies a relationship which is sometimes described in terms of cause and effect, as by Aristotle, and

sometimes in terms of antecedent and consequent, as by Hobbes. The premises (*i.e.*, the statements which precede the "therefore") cause the conclusion, it is said. We know that Socrates is mortal *because* we know that Socrates is a man and that all men are mortal. The premises are the cause in the sense of the *reason why* the conclusion may be regarded as true.

The conclusion is also said to *follow from* the premises, or the premises are said to *imply* or *yield* the conclusion. *If* the premises are true, *then* the truth of the conclusion can be inferred or proved. The relationship between the premises and the conclusion seems to be the same whether the act of reasoning is called "proof" or "inference." The distinction in meaning between these two words seems to be one of direction. We speak of "proving" a conclusion when we look toward the premises as the foundation for its truth; we speak of "inferring" a conclusion when we look toward it as something which can be drawn from the premises.

The words "if" and "then" indicate that reasoning is a motion of the mind from one statement to another. Sometimes the inference is immediate, as when we argue that if all men are mortal, then some mortals are men. Here only two propositions are involved, one of which is simply the converse of the other. Those who deny that immediate inference is truly inference (because a proposition and its converse are merely two ways of stating the same fact), insist that, implicitly or explicitly, reasoning always involves *at least* three statements. In any case, a single statement like "Socrates is a man," or even a pair of statements connected by "and" rather than "if-then"—*e.g.*, "Socrates is a man and Socrates is mortal"—does not express what is commonly recognized as reasoning. The motion of reasoning does, however, appear in this sequence of statements, "If Socrates is a

man, then Socrates is mortal," even though it omits a statement that may be necessary to the validity of the reasoning, namely, "All men are mortal."

Thus, the familiar grammatical distinctions of word (or phrase), sentence, and paragraph do not seem to provide a perfect parallel for the distinctions which the logicians make between terms, propositions, and syllogisms. But this much is clear. Just as a single word or phrase, like "man" or "rational animal," can never express a proposition, but only a term, so a simple sentence expresses only a proposition, and never a syllogism; and a compound sentence, one made up of a number of sentences, expresses a syllogism only if its verbal construction somehow indicates that they form a sequence in which one *follows* from the others, or if they are related in such a way that the truth of one is caused by the truth of the others.

THE CHAPTER ON IDEA (and perhaps also the chapter on DEFINITION) deals with that content or act of the mind—whether a percept or a concept, an image or an abstraction—which is verbally expressed in words or phrases and of which the *term* is the logical representative. The chapter on JUDGMENT (and perhaps also the chapter on PRINCIPLE) deals with the mental act or content that requires a sentence for its expression and is logically represented by the *proposition*. Here we are concerned with mental activity which involves not only two or more ideas, but also two or more judgments so connected that the mind passes from one to another.

Whether the logical structure that Aristotle calls a "syllogism" represents all forms of the mental activity called reasoning, is one of the great traditional issues. Hume suggests, for example, that animals reason without making use of syllogisms; and Descartes and Locke seem to hold that the highest forms of thinking, such as occur in mathematics or philosophy, cannot be reduced to syllogisms, except perhaps by a *tour de force*.

We face a different sort of problem when we compare reasoning with other acts of the mind—with conception (or the having of ideas) and with judgment (or the connecting of ideas with one another in the manner which mediaeval writers call "composition and division"). No

one denies that reasoning is thinking, nor does anyone deny that there are forms of thinking which are not reasoning, since conceiving and judging are generally regarded as kinds of thinking or modes of thought. Reasoning is merely that mode of thought which is a *process*—the going step by step from one statement to another.

The problem which arises from the comparison of reasoning with other modes of thought turns on the question whether the mind can learn anything without having to think rationally. Can certain things be known by insight or instinct, by induction or intuition, rather than by reasoning? Are there truths which cannot be known by reasoning at all, but only by some other mode of thought? These questions in turn raise the problem of the priority or superiority of such modes of thought as do not consist in reasoning. The theory discussed in the chapter on INDUCTION—that induction is prior to reasoning because intuitive generalization from experience must provide the starting-points for demonstration—indicates one solution of the problem. Our present concern, however, goes beyond the issue concerning induction and deduction to the most general contrast between the intuitive and the rational.

FOR PLOTINUS ANY FORM of thinking—not merely reasoning—signifies a deficiency or weakness. In the scale of intellectual beings man occupies the lowest rank because he reasons. But even the pure intelligences, which know intuitively, rank below the One, because even the simplest act of thought involves some duality of subject and object. The One, according to Plotinus, transcends thought even as it transcends being. "The super-essential," he says, "is the supra-cognitive." The One "has no need for intellection, being always self-sufficing."

Other writers do not go as far as this. Christian theologians do, however, contrast the human mind with the angelic intellect and the mind of God by saying that the latter are supra-rational, *i.e.*, above the need to reason. They do not, like Plotinus, hold that the transcendent being transcends thought itself—certainly not insofar as they discuss the divine ideas. But the kind of thinking which is not an instantaneous act of vision or an immediate intuition involves

the mind in a process of thought, somehow akin to change or motion; and this, the theologians hold, cannot take place in any immutable being—the angels or God.

The human intellect, according to Aquinas, gradually comes to know the truth “by a kind of movement and discursive intellectual operation . . . by advancing from one thing known to another. But if from the knowledge of a known principle [men] were straightway to perceive as known all its consequent conclusions, then there would be no place for discursiveness in the human intellect. Such is the condition of the angels, because in the truths which they know naturally, they at once behold all things whatsoever that can be known in them.”

That, says Aquinas, is why the angels “are called *intellectual* beings” and men “are called *rational*.” Recourse to reasoning on the part of men betrays “the feebleness of their intellectual light. For if they possessed the fullness of intellectual light, like the angels, then in the first grasping of principles they would at once comprehend all that they implied, by perceiving at once whatever could be reasoned out of them.”

The type of intuitive apprehension which the angels enjoy is even more perfectly exemplified in God’s knowledge. “In the divine knowledge,” according to Aquinas, “there is no discursiveness”—no succession, neither the turning from one thought to another, nor the advance from the known to the unknown by reasoning from principles to conclusion. The divine knowledge, Aquinas explains, is a single all-embracing act of vision, in which “God sees all things in one thing alone, which is Himself,” and therefore “sees all things together and not successively.” Apart from participation in the vision of God through supernatural light, all human thinking on the natural plane is discursive. Even the conception and the judgment are discursive in the sense that the one involves an act of abstraction or definition and the other involves a composition or division of concepts. But though it is always discursive, human thinking is not, according to Aquinas, always involved in the *motion* of reasoning, that is, the transition from one thought to another. “Reasoning,” he says, “is compared to understanding”—i.e., the act of judgment by which we

affirm or deny a single proposition—“as movement is to rest, or acquisition to possession.”

DESCARTES USES THE WORD “intuition” to name the way in which we know certain truths immediately and with certitude. He distinguishes “intuition from deduction by the fact that into the conception of the latter there enters a certain movement or succession, into that of the former there does not. . . . The first principles are given by intuition alone, while, on the contrary, the remote conclusions are furnished only by deduction.” But while deduction, which Descartes says he understands to be “all necessary inference from other facts that are known with certainty,” supplements intuition, it is never at any stage of the reasoning process independent of intuition.

Not only does intuition, according to Descartes, supply the first principles or ultimate premises of reasoning, but it also certifies each step in the process. He asks us to “consider this consequence: 2 and 2 amount to the same as 3 and 1. Now we need to see intuitively not only that 2 and 2 make 4, and that likewise 3 and 1 make 4, but further that the third of the above statements is a necessary conclusion from these two.”

If in addition to knowing the premises by intuition, the drawing of a conclusion from them is, as Descartes says, itself “effected by intuition”—if the act of inference rests on the intuition that the conclusion follows logically from the premises—in what way does deduction or reasoning supplement intuition? To this question, Descartes replies that though the mind “has a clear vision of each step in the process,” it cannot comprehend in one intuition all the connections involved in a long chain of reasoning. Only by taking the steps one after another can we “know that the last link in a long chain is connected with the first, even though we do not take in by means of one and the same act of vision all the intermediate links on which that connection depends, but only remember that we have taken them successively under review.”

Like Descartes, Locke contrasts intuition and reasoning, or intuitive and demonstrative knowledge. “Sometimes the mind perceives the agreement or disagreement of two ideas immediately by themselves, without the interven-

tion of any other: and this," says Locke, "we may call intuitive knowledge. . . . When the mind cannot so bring its ideas together, as by their immediate comparison . . . to perceive their agreement or disagreement, it is fain by the intervention of other ideas . . . to discover the agreement or disagreement which it searches; and this is that which we call reasoning."

Again like Descartes, Locke asks, "What need is there of reason?" It is necessary, he thinks, "both for the enlargement of our knowledge and regulating our assent . . . Sense and intuition reach but very little of the way. The greatest part of our knowledge depends upon deductions and intermediate ideas; and in those cases where we are fain to substitute assent instead of knowledge, and take propositions for true without being certain they are so, we have need to find out, examine, and compare the grounds of their probability." But though reasoning enlarges our knowledge beyond what can be known intuitively, reasoning produces certain knowledge, according to Locke, only if "every step in reasoning . . . has intuitive certainty. . . . To make anything a demonstration, it is necessary to perceive the immediate agreement of the intervening ideas, whereby the agreement or disagreement of the two ideas under examination (whereof the one is always the first, and the other the last, in the account) is found."

On this view of reasoning, nothing can be known demonstratively or by proof unless some things can be known intuitively, *i.e.*, without inference or proof. Locke and Descartes seem to agree with Aquinas and Aristotle that demonstration depends upon indemonstrable truths, whether these are called axioms, immediate propositions, first principles, or self-evident maxims. Locke and Descartes, on the one hand, stress the point that in reasoning the logical connection between premises and conclusion is also indemonstrable and must be intuitively perceived. Aquinas and Aristotle, on the other, repeatedly observe that the truth of the conclusion is implicitly contained in the truth of the premises, so that the advance which reasoning appears to make from the known to the unknown consists in coming to know actually what is already potentially known. Nevertheless they, unlike Descartes and Locke, maintain

that reasoning extends knowledge, even though it may not be the method of initial discovery.

A somewhat contrary view seems to be taken by Hume. If the objects under consideration are matters of fact rather than the relations between our own ideas, the kind of reasoning which goes from premises to conclusion avails not at all. The beliefs we hold about such matters, according to Hume, result from mental operations which are "a species of natural instinct . . . which no reasoning or process of thought is able either to produce or to prevent." What he calls "experimental reasoning" or "reasoning concerning matters of fact" is founded, he says, "on a species of Analogy, which leads us to expect from any cause the same events which we have observed to result from similar causes."

Not only men, but also animals reason in this way. But Hume thinks "it is impossible that this inference of the animal can be founded on any process of argument or reasoning by which he concludes that like events must follow like objects. . . . The experimental reasoning itself, which we possess in common with beasts, and on which the whole conduct of life depends, is nothing but a species of instinct or mechanical power, that acts in us unknown to ourselves; and in its chief operations is not directed by any such relations or comparisons of ideas, as are the proper objects of our intellectual faculties."

THE FOREGOING considerations indicate how diverse theories of the role of reasoning arise from diverse theories of the nature and kinds of knowledge in animals, men, angels, and God. According as various distinctions are made between human knowledge and opinion, or between the way in which different objects can be known, or between speculative and practical interests, so, too, different formulations are given of the nature of reasoning.

Aristotle's distinction, for example, between scientific and dialectical or rhetorical reasoning turns upon his understanding of the difference between the objects of certain knowledge and the objects of probable opinion. This difference, he says, makes it "equally foolish to accept probable reasoning from a mathematician and to demand from a rhetorician scientific proofs."

Hume's distinction between *a priori* and *a posteriori* reasoning—i.e., between reasoning from principles and reasoning from experience—depends upon his understanding of what matters must be submitted to experience and of the manner in which experience generates belief. The distinction which Aquinas makes between demonstrations *propter quid* and demonstrations *quia*—i.e., between proving *what* something is from its causes and proving *that* it is from its effects—depends upon his understanding of the difference between essence and existence as objects of rational knowledge.

To take an example in the opposite vein, Locke's theory that the same type of demonstration is possible in both mathematics and the moral sciences, seems to rest upon his view that all knowledge consists in the comparison of ideas. In contrast to this, other theories, which hold that the mode of reasoning differs in different disciplines (especially in mathematics and morals, or in metaphysics and the natural sciences), seem to arise from the contrary view that, in these different fields of inquiry, the objects and conditions of knowledge are different.

Sometimes a distinction in the modes of reasoning is based upon the same considerations, but the distinction itself is expressed by different writers in different terms. The role of causes in reasoning appears to underlie Aquinas' distinction between *a priori* and *a posteriori* reasoning, or reasoning from cause to effect as opposed to reasoning from effect to cause. "Demonstration can be made in two ways," he writes; "one is through the cause and is called *a priori*, and this is to argue from what is prior absolutely. The other is through the effect, and is called a demonstration *a posteriori*; this is to argue from what is prior relatively only to us." Descartes appears to make a parallel distinction, though he makes it in different terms. "The method of proof is twofold," he says, "one being analytic, the other synthetic. Analysis shows the true way by which a thing was methodically discovered, as it were effect from cause. . . . Synthesis employs an opposite procedure, one in which the search goes as it were from effect to cause." For both mathematical and metaphysical reasoning, Descartes prefers the analytic to the synthetic method.

According to Newton, the method of analy-

sis, in natural science as well as mathematics, consists in going from effects to causes, while the method of synthesis goes from causes to effects. Newton relates the difference between analysis and synthesis to the difference between inductive and deductive reasoning. This way of distinguishing between inductive and deductive reasoning, in terms of going from effects to causes or from causes to effects, would also seem to be related to the distinction Aquinas makes between demonstration *quia* (i.e., reasoning which proves only *that* something exists) and demonstration *propter quid* (i.e., reasoning which proves *what* something is—its nature or properties). The proof that God exists is, according to Aquinas, a demonstration *quia*; it is also *a posteriori* reasoning or reasoning from effect to cause. But he would not call it "inductive." In one passage at least, he seems to regard induction as the method whereby we can come to some knowledge of what God is. "From natural things," he writes, "one does not come by a demonstration of reason to know non-natural things, but by the induction of reason one may know something above nature, since the natural bears a certain resemblance to the supernatural."

This sense of the word "induction," however, is like that in which Aristotle opposes induction to reasoning, not like that in which he distinguishes between inductive and deductive reasoning according to the order of terms in the inductive and deductive syllogism. In the ordinary deductive syllogism, the middle term establishes the connection between the two extreme terms (for example, 'being a man' establishes the connection between 'Socrates' and 'being mortal'). But "the syllogism which springs out of induction," according to Aristotle, establishes "a relation between one extreme and the middle by means of the other extreme, e.g., if B is the middle term between A and C, it consists in proving through C that A belongs to B." Starting from C (particular cases of long-lived animals, such as man, horse, mule), we can argue inductively from the fact that these long-lived animals are bileless, to the general connection between B (being bileless) and A (being long-lived). Such reasoning is valid, Aristotle adds, only if we can treat C "as made up of all the particulars; for induction

proceeds through an enumeration of all the cases."

DIFFERENT THEORIES of definition also affect the place which is assigned to definition in reasoning. Hobbes, for example, regards reasoning as a kind of calculation with names, which wholly depends upon the determination of their meanings. The operations of addition and subtraction when done with words rather than with numbers are, he thinks, equivalent to "conceiving of the consequence of the names of all the parts, to the name of the whole; or from the names of the whole and one part, to the name of the other part." It is "nothing but *reckoning* (that is, adding and subtracting) of the consequences of general names agreed upon." Aristotle, with the theory that definitions state the essential natures of things, not just the meanings of words, holds that a definition may be "the conclusion of a demonstration giving essential nature," as well as "an indemonstrable statement of essential nature." In the latter case, the definition functions as a principle in demonstration.

According to William James, reasoning, like definition, is "a selective activity of the mind" which serves an individual's interest or purpose. "My thinking," he says, "is first, last, and always for the sake of my doing. . . . Reasoning is always for a subjective interest, to attain some particular conclusion, or to gratify some special curiosity." It makes no difference whether the interest is practical or the curiosity speculative. The process of reasoning will be the same, though the element which provides a solution to the problem in any emergency will be called a "'reason' if the emergency be theoretical, a 'means' if it be practical."

Those writers who, like Aristotle and Aquinas, regard the speculative and the practical as distinct though related orders of thought and knowledge, seem to think that practical reasoning has its own syllogistic form. Practical deliberations for them are different from theoretic demonstrations. The conclusion of theoretic reasoning is an assertion that something is either true or false, whereas the conclusion of practical deliberation is a judgment that something is good or evil, and therefore should either be done or avoided. According to Aristotle, prac-

tical reasoning of the sort which ends in a decision that leads to action, takes the form of a syllogism which has one universal and one particular premise. The major premise is a general rule of conduct, the minor premise a particular perception of fact. In the example Aristotle gives of the practical syllogism, the major premise is the rule that *everything sweet ought to be tasted*, and the minor premise is the perception that *this particular thing is sweet*. These two premises lead to the practical conclusion that *this particular thing ought to be tasted*.

Not all practical reasoning, however, is concerned with reaching decisions or prompting action in particular cases. The rules of conduct which decisions and actions apply may themselves be the products of practical reasoning. The process by which general rules are derived from even more general principles—the precepts of law or morality—involves, according to Aquinas, a form of thinking distinctly different from the theoretic or speculative sort. He points out in his *Treatise on Law* that we are able to formulate certain practical rules only by making particular determinations of universal principles, not by drawing deductions from them. "Something may be derived from the natural law in two ways," he writes: "first, as a conclusion from premises; secondly, by way of determination of certain generalities. The first way is like that by which, in the speculative sciences, demonstrated conclusions are drawn from the principles; while the second mode is likened to that whereby, in the arts, general forms are particularized as to details." Of these two ways of thinking in the field of law, it would appear that it is only the second type which is peculiar to the practical as opposed to the speculative order.

THE DISCUSSION OF reasoning in relation to knowledge, opinion, and action, or in relation to different disciplines and sciences, usually presupposes a theory of the form which reasoning takes regardless of its subject matter or use. This fact is most explicitly attested by the order of three great books concerned with reasoning. Aristotle's *Posterior Analytics* deals with the theory of demonstration in the sciences. His *Topics* deals with the theory of probable argument or reasoning in the sphere of opinion.

Both are preceded by his *Prior Analytics* which treats of the syllogism in terms of its purely formal structure and its various forms. In the later tradition, the distinction between the problems of the *Prior* and the *Posterior Analytics* comes to be represented by the separation between what are called "formal" and "material" logic.

The formal analysis of reasoning centers on the problem of its cogency. Quite apart from any consideration of the truth of its premises or conclusions, reasoning is true or false according as it is valid or invalid on purely logical grounds. From premises which are in fact false, a conclusion, which may be either true or false, can be truly inferred if the structure of the reasoning is formally valid—that is, if the form of the premises stands in a certain logically prescribed relation to the form of the conclusion. The logical problem, then, is to prescribe the formal relationships among propositions which permit valid inference from certain propositions to others, without regard to the content of the propositions or their truth in fact.

Defining a syllogism as "discourse in which, certain things being stated, something other than what is stated follows of necessity from their being so," Aristotle says, "I call that a perfect syllogism which needs nothing other than what has been stated to make plain what necessarily follows; a syllogism is imperfect, if it needs either one or more propositions which are indeed the necessary consequences of the terms set down, but have not been expressly stated as premises." Using the letters S and P to symbolize the subject and predicate of the conclusion, and the letter M to symbolize the middle term, the term which appears in the premises but not in the conclusion, Aristotle states the form of a perfect syllogism in the following manner: "All M is P, all S is M; therefore all S is P."

The first of these propositions, the one which contains the predicate of the conclusion, is called the major premise; the second, the one which contains the subject of the conclusion, the minor premise; the subject of the conclusion is called the minor term, the predicate the major term. Aristotle classifies syllogisms into three figures, or formal types, according to the position of the middle term, either as subject of the major premise and predicate of the minor

in the first figure, or as predicate in both or as subject in both in the second and third figures respectively. Then according to whether the premises are universal propositions or particular ('All M is P' or 'Some S is M'), and each is either affirmative or negative ('All M is P' or 'Some S is not M'), he further distinguishes within each figure a number of valid moods, or formally correct patterns of inference.

For example, in no figure can a valid mood be constructed with two particular or two negative premises. No conclusion can be drawn from the two particular statements that some poisons are liquids and that some liquids are indispensable to life; nor can any conclusion be drawn from the two negative statements that no triangles are parallelograms and no rhomboids are parallelograms. In the first figure, the minor premise can be particular and must be affirmative, the major can be negative and must be universal. In this figure the following combinations of premises—"some figures are not rectangular" with "all rectangular figures are parallelograms," or "all prime numbers are odd" with "some odd numbers are squares"—yield ~~no~~ conclusions. In the second figure, one premise must be negative. Here it is impossible to draw a valid conclusion from two affirmative premises. Nothing follows from the two affirmative statements that all fish swim and all whales swim. In the third figure, only a particular conclusion can be drawn from a pair of premises both of which are universal. From the proposition that no men are wise and the proposition that all men are mortal, we can conclude only that some mortals are not wise.

From these examples it will be seen that Aristotle's rules of the syllogism are rules concerning the quantity and quality of the premises required in each figure to permit a valid inference; and as in the third figure these rules permit only a particular conclusion to be drawn, so for all figures they determine the character of the conclusion which can be drawn from premises of a certain quantity and quality. If one premise is negative, the conclusion must be negative. If one premise is particular, the conclusion must be particular.

There seems to be one universal principle of the syllogism which underlies all these specific rules for the valid moods in different figures.

"When one thing is predicated of another," Aristotle says, "all that which is predicable of the predicate will be predicable also of the subject." The negative aspect of this principle is immediately obvious. What cannot be predicated of a predicate, cannot be predicated of its subject. In the tradition of formal logic, this principle is sometimes stated in terms of the relation of classes rather than in terms of subjects and predicates: if one class is included in a second, and that second class is included in a third, the first is included in the third; and if one class excludes another, the classes which it includes are also excluded from that other.

The principle of the syllogism is traditionally called the *dictum de omni et nullo*. The *dictum de omni*, which Kant in his *Introduction to Logic* calls "the supreme principle of affirmative syllogisms," is thus expressed by him: "Whatever is universally affirmed of a concept is also affirmed of everything contained under it." The *dictum de nullo*, according to Kant, states that "whatever is universally denied of a concept is also denied of everything that is contained under it." Kant appears to think that both these rules follow from even more general principles; that "an attribute of an attribute is an attribute of the thing itself" and that "whatever is inconsistent with the attribute of a thing is inconsistent with the thing itself."

James also attempts to make a more general formulation of the *dictum de omni et nullo*. This law of thought, he says, is "only the result of the function of comparison in the mind which has come by some lucky variation to apprehend a series of more than two terms at once." As James states what he calls the "principle of mediate comparison," it appears to be broader than the principle of the syllogism. It applies to any series of related terms—to the relation of equal and unequal quantities in mathematics, as well as to the relation of subjects and predicates in the logic of predication or classes.

James' principle of mediate comparison itself depends on what in mathematical logic and the logic of relations is called the "transitivity" of relations. The relation of *larger than*, for example, is transitive; for if one thing is larger than a second, and the second is larger than a third, it follows that the first is larger than the third. As stated in mathematical logic, the principle of

the syllogism is merely a special case of transitivity as it appears in the relation of implication; for if P implies Q, and Q implies R, then P implies R.

James recognizes this when he writes that "the principle of mediate predication or subsumption is only the axiom of skipped intermediaries applied to a series of successive predications. It expresses the fact that any earlier term in the series stands to any later term, in the same relation in which it stands to any intermediate term; in other words, that *whatever has an attribute has all the attributes of that attribute*; or more briefly still, that *whatever is of a kind is of that kind's kind*." Along with "the axiom of mediate equality, 'equals of equals are equal,'" the rule of mediate predication or subsumption is, according to James, a special case of the law that "skipping intermediary terms leaves relations the same. This AXIOM OF SKIPPED INTERMEDIARIES OR OF TRANSFERRED RELATIONS . . . seems to be on the whole the broadest and deepest law of man's thought."

JAMES' ATTEMPT to state a law of thought or principle of reasoning which relegates all the rules of the syllogism to the status of a special case represents one type of attack on the syllogism. Whether, for instance, the sample of reasoning which Descartes asks us to consider—that if 2 and 2 make 4, and 3 and 1 make 4, then 2 and 2 amount to the same as 3 and 1—can be reduced to the syllogistic form of subject and predicate, or must be formulated under a more general principle of "transferred relations," illustrates the basic issue here between subject-predicate logic and relational or mathematical logic. Other aspects of that issue are discussed in the chapters on LOGIC, JUDGMENT, and RELATION.

Another type of criticism of the traditional theory of the syllogism accepts the syllogism as the form of *all* reasoning, but objects, as Kant does, to what he calls "the mistaken subtilty" of the classification of syllogisms according to figures and moods. But Kant does not deny all distinctions among syllogisms. On the contrary, he says that syllogisms are "threefold, like all judgements, differing from each other in the manner in which they express the relation of knowledge in the understanding, namely, cate-

gorical, hypothetical, and disjunctive." Whether the hypothetical and disjunctive syllogisms are distinct types of reasoning, or only special cases which it would be a mistaken subtlety to treat as having principles of their own, is a problem considered in the chapter on *HYPOTHESIS*.

Of all criticisms, the most severe is that which either rejects the syllogism entirely as of no use in reasoning, or regards the deductive syllogism as useful only in argumentation or debate, not in the process of inquiry or discovery, where inductive reasoning alone is fruitful or instructive. From the conclusion of a syllogism, according to Mill, one learns nothing more than one already knew in the premises; whereas in inductive reasoning, Mill, like Bacon, thinks that the mind goes beyond anything contained in the premises and genuinely discovers a new truth.

It seems to be Descartes' opinion that "the syllogistic forms are of no aid in perceiving the truth about objects." Locke makes the same point more extensively. Admitting that "all right reasoning may be reduced to [Aristotle's] forms of syllogism," he denies that they are "the best way of reasoning for the leading of those into truth who are willing to find it and desire to make the best use of their reason for the attainment of knowledge. . . . The rules of syllogism," he writes, "serve not to furnish the mind with those intermediate ideas that may

show the connexion of remote ones. This way of reasoning discovers no new proofs, but is the art of marshalling and ranging the old ones we have already. The forty-seventh proposition of the first book of Euclid, is very true; but the discovery of it, I think, not owing to any rules of common logic. A man knows first, and then he is able to prove syllogistically; so that syllogism comes after knowledge, and then a man has little or no need of it. . . . Syllogism, at best, is but the art of fencing with the little knowledge we have, without making any addition to it."

It may be that the critics of the syllogism attribute to its exponents claims they do not make. Aristotle, for example, seems to present the syllogism as a method of expounding arguments rather than of discovering them, and of testing the validity of reasoning rather than of learning the truth about things. "All instruction given or received by way of argument," he writes, "proceeds from pre-existent knowledge. This becomes evident upon a survey of all the species of instruction. The mathematical sciences, and all other speculative disciplines, are acquired in this way, and so are the two forms of dialectical reasoning, syllogistic and inductive; for each of these latter makes use of old knowledge to impart new, the syllogism assuming an audience that accepts its premises, induction exhibiting the universal as implicit in the clearly known particular."

OUTLINE OF TOPICS

	PAGE
1. Definitions or descriptions of reasoning: the process of thought	556
1a. Human reasoning compared with the reasoning of animals	
1b. Discursive reasoning contrasted with immediate intuition	557
1c. The role of sense, memory, and imagination in reasoning: perceptual inference, rational reminiscence, the collation of images	
2. The rules of reasoning: the theory of the syllogism	558
2a. The structure of a syllogism: its figures and moods	
(1) The number of premises and the number of terms: the middle term in reasoning	
(2) Affirmation, negation, and the distribution of the middle term: the quantity and the quality of the premises	
2b. The kinds of syllogism: categorical, hypothetical, disjunctive, modal	
2c. The connection of syllogisms: sorites, pro-syllogisms and epi-syllogisms	

3. The truth and cogency of reasoning	
3a. Formal and material truth: logical validity distinguished from factual truth	
3b. Lack of cogency in reasoning: invalid syllogisms; formal fallacies	559
3c. Lack of truth in reasoning: sophistical arguments; material fallacies	
3d. Necessity and contingency in reasoning: logical necessity; certainty and probability	
4. The types of reasoning, inference, or argument	
4a. Immediate inference: its relation to mediated inference or reasoning	
4b. The direction and uses of reasoning: the distinction between proof and inference, and between demonstration and discovery	560
4c. Inductive and deductive reasoning	
4d. Direct and indirect argumentation: proof by <i>reductio ad absurdum</i> ; argument from the impossible or ideal case	
4e. Refutation: disproof	
4f. Reasoning by analogy: arguments from similarity	
5. Reasoning in relation to knowledge, opinion, and action	561
5a. The fact and the reasoned fact: mere belief distinguished from belief on rational grounds	
5b. Scientific reasoning: the theory of demonstration	
(1) The indemonstrable as a basis for demonstration	
(2) Definitions used as means in reasoning: definitions as the ends of reasoning	562
(3) <i>A priori</i> and <i>a posteriori</i> reasoning: from causes or from effects; from principles or from experience; analysis and synthesis	
(4) The role of causes in demonstration and scientific reasoning	
(5) Demonstration in relation to essence and existence: demonstrations <i>propter quid</i> and <i>quia</i>	563
5c. Dialectical reasoning: the opposition of rational arguments	
5d. Rhetorical reasoning: the rational grounds of persuasion	564
5e. Practical reasoning	
(1) The form of the practical syllogism	
(2) Deduction and determination in legal thought	
(3) Deliberation: the choice of alternative means; decision	565
6. The character of reasoning in the various disciplines	
6a. Proof in metaphysics and theology	
6b. Demonstration in mathematics: analysis and synthesis	
6c. Inductive and deductive inference in the philosophy of nature and the natural sciences	566
6d. Induction and demonstration in the moral sciences	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Definitions or descriptions of reasoning: the process of thought

Chapter 78: RELATION

INTRODUCTION

LIKE quantity and quality, relation is generally recognized as a basic term or category. But its meaning, like theirs, cannot be defined. Relation is, perhaps, the prototype of an indefinable notion. As Bertrand Russell points out, it seems to be impossible to make any statement of what relation is without using the notion of relation in doing so.

Any term which is essentially relative seems also to be incapable of definition. Its meaning cannot be stated without referring to its correlative; and since the meaning of the latter reciprocally involves the former as *its* correlative, each member of a pair of correlative terms draws upon the other for its meaning. A part is a part of a whole; a whole, a whole of parts. Similarly, the meaning of parent involves the notion of child and the meaning of child the notion of parent.

Plato applies this maddening fact about correlative terms to all comparatives which presuppose the correlation of more and less. "Comparatives such as the hotter and the colder," he writes, "are to be ranked in the class of the infinite." They cannot be measured or defined. Terms like 'much' and 'little,' 'great' and 'small' look like quantities, but, according to Aristotle, they are "not quantities, but relatives, for things are not great or small absolutely; they are so called rather as the result of an act of comparison."

Concerning quantities and qualities, the ancients ask how they exist. The alternatives seem to be either that they exist in and of themselves, or that they exist as the attributes of substances such as stones and trees. But with regard to relations, the question seems to be whether they exist rather than how they exist.

The supposition that a relation cannot exist apart from the terms it relates may be thought to imply that the relation does exist when the

terms it relates exist. The ancients, however, do not appear to regard the relation as something having a reality distinguishable from the reality of the correlative terms. It seems to be significant that both Plato and Aristotle discuss relative terms, rather than relations as such. For the most part, they signify relations by using a pair of words which name things standing in a certain relation to one another.

Thus in the *Categories*, Aristotle refers to 'double' and 'half,' 'master' and 'slave,' 'greater' and 'less,' or 'knowledge' and 'object known' as examples of correlative terms. "All relatives," he says, "have a correlative." Sometimes it is necessary to find the precise word, or even to invent the right word, for in order to indicate that a given term is relative, its correlative must be appropriately named. "Concubine," says Locke, "is, no doubt, a relative name, as well as wife; but in languages where this, and like words, have not a correlative term, there people are not so apt to take them to be so, as wanting that evident mark of relations which is between correlatives, which seem to explain one another, and not to be able to exist but together."

When "reciprocity of correlation does not appear to exist," Aristotle suggests that it may be the result of our failure to use words carefully. If we wish to use the term 'rudder' as relative, we cannot call its correlative a 'boat,' for "there are boats which have no rudders." Since there is no existing word, it would be "more accurate," Aristotle thinks, "if we coined some word like 'ruddered' to name the correlative of 'rudder.'" Similarly, in the case of 'slave' as a relative term, its correlative is not 'man' understood in any sense, but only man understood as 'master.'

The things which are designated by a pair of reciprocally relative terms must, according to

Aristotle, coexist. One man cannot be called a master unless another man exists who can be called his slave; something cannot be called larger unless something coexistent with it can be called smaller. Aristotle considers possible exceptions to this principle of the simultaneity or coexistence of correlatives; as, for example, in the case of knowledge and the knowable. It seems possible, he thinks, for the knowable to exist before anyone has actual knowledge of it. But the exception may be due to an improper naming of the correlatives. If the correlative of knowledge is the known rather than the knowable, then knowledge and its object may be said to be necessarily coexistent, for nothing comes to be an object actually known, except simultaneously with someone's coming actually to know it.

THE COEXISTENCE of things which are correlative to one another still leaves a question concerning the existence of the relation between them. When conceived as an attribute, a quality or a quantity can be said to exist in the thing it somehow modifies. In the language of Aristotle, such accidents *inhere in* substances, and accordingly have reality as long as the substances in which they inhere exist. But a relation does not seem to inhere in a substance. It cannot be the attribute of a single thing. It somehow lies between two things, inhering in neither, for if it belonged to either one alone it could have some reality if that one existed and the other did not. The question, therefore, is whether relations really exist at all, or are only in the mind of him who compares things or considers them relative to one another.

"A sign that the relative is least of all a substance and a real thing," writes Aristotle, "is the fact that it alone has no proper generation or destruction or movement; as in respect of quantity there is increase and diminution, in respect of quality alteration, in respect of place locomotion, in respect of substance simple generation and destruction. In respect to relation there is no proper change; for, without changing, a thing will be now greater and now less or equal, if that with which it is compared has changed in quantity."

Plotinus also questions the reality of relations. "Has relation—for example, that of

right and left, double and half—any actuality? . . . What can be the meaning of correlatives apart from our conception of their juxtaposition? 'Greater' may refer to very different magnitudes; 'different' to all sorts of objects. The comparison is ours; it does not lie in the things themselves." In the case of certain space and time relations he maintains that "right and left are in our conception, nothing of them in the things themselves. Before and after are merely two things; the relation is again of our making."

Yet Plotinus seems unwilling to say that "we do not mean anything by relation, but are victims of words," or that "none of the relations mentioned can exist." Recognizing what he calls "the elusive character of relation," he is willing to affirm the reality of relations "when the actuality of the relationships is derived from no other source than relation itself." He thinks that one quantity may be the double of another, "quite apart from our speech or thought." The fact that one quantity is the double of another is an additional fact about the two quantities over and above all their other properties. "In all the conditions in which we assert relation," Plotinus declares, "the mutual relation exists over and above the objects; we perceive it as already existent; our knowledge is directed upon a thing, there to be known—a clear testimony to the reality of relation."

The problem thus seems to become one of distinguishing between relations which have independent reality and those which exist only in the mind. "Some have said that relation is not a reality but only an idea. But this," Aquinas declares, "is plainly seen to be false from the very fact that things themselves have a mutual order and relation." Not all relations are real, however. "Relations which result in the things understood from the operation of the intellect alone are logical relations only, inasmuch as reason observes them as existing between two understood things." For example, "the relation of a thing to itself is not a real relation," for "reason, by apprehending one thing twice, regards it as two; and thus it apprehends a certain relation of a thing to itself . . . The same is true of those relations that follow upon an act of reason, as genus and species, and the like."

Aquinas offers, in contrast, "other relations which are realities with regard to both extremes; as when a relation exists between two things according to some reality that belongs to both. This is clear of all relations consequent upon quantity, great and small, double and half, and the like; for there is quantity in both extremes."

This distinction between real and logical relations seems to be qualified by the intermediate case of a relation which is partly logical and partly real; for, according to Aquinas, "sometimes a relation in one extreme may be a reality, while in the other extreme, it is only an idea. This happens whenever the two extremes are not of one order . . . Since God is outside the whole order of creation and all creatures are ordered to Him, and not conversely, it is manifest that creatures are really related to God Himself; whereas in God there is no real relation to creatures, but a relation only in idea, inasmuch as creatures are related to Him."

In the *Charmides*, Socrates raises some doubts about the admissibility of reflexive relations, or the relations of things to themselves. Others have questioned the partly real and partly logical relation, according to which one thing is related to another but the second is not related to the first. But the more important issues, in the tradition of western thought, seem to be whether there are both real and logical relations, *i.e.*, relations both in nature and in the mind, and whether, in either case, relations enter into the very nature of the things related or are merely external, so that the character of a thing is unaffected by the relations in which it stands.

AS INDICATED IN THE chapters on JUDGMENT, REASONING, and LOGIC, relation tends to displace predication in certain typically modern theories of the proposition and of inference. What is currently called "relational logic" is set against "subject-predicate logic." Relations themselves, without regard to the character of the terms related, become the primary object of logical analysis. It is said, for example, that the proposition 'John hit James' has the form ' aRb ' or ' $R(a,b)$,' and that the proposition 'John went to school with James' has the form

' $R(a,b,c)$.' The first is a dyadic relation, the second a triadic relation.

Relations are classified not only with respect to the number of the terms they relate, but also with respect to such formal properties as symmetry, transitivity, reflexivity. The relation of parent and child, for example, is asymmetrical. It cannot be said, if A is the parent of B, that B is also the parent of A; whereas the relation of brotherhood is symmetrical. Statements of symmetrical relationship are convertible. If we say that A is the brother of B, we can also say that B is the brother of A.

The type of relationship remains the same regardless of the character of the terms. Unequal quantities are asymmetrically related, equal quantities symmetrically; 'to-the-right-of' is an asymmetrical spatial relation, 'next-to' is symmetrical; in time, 'simultaneous-with' is symmetrical and 'prior-to' asymmetrical. The distinction between transitive and intransitive relations similarly holds for all kinds of terms. The relation of father to son or of 'standing-next-to' in space is intransitive, for if A is the father of B, and B the father of C, A is not the father of C; whereas the spatial relation of 'standing-to-the-right-of' is transitive, for if A is to the right of B, and B to the right of C, then A is to the right of C.

The modern analysis of propositions as relational structures which differ in type according to the character of the relations, not the character of the terms, has an antecedent in Locke's analysis of judgments as acts of comparison which look to the relation between ideas rather than to the ideas themselves. Both analyses lead to a theory of inference which is based on the *convertibility* of symmetrical relations and on the *transitivity* of certain relationships and the intransitivity of others. As indicated in the chapter on REASONING, the factor of transitivity appears in William James' discussion of the "principle of mediate comparison." He states this in the formula "*more than the more is more than the less.*" Then he explains that "such a formula would cover all possible cases; as, earlier than early is earlier than late, worse than bad is worse than good, east of east is east of west; etc., etc., *ad libitum*. Symbolically, we might write it as $a < b < c < d \dots$ and say that any number of intermediaries may be ex-

punged without obliging us to alter anything in what remains written."

James thus formulates what he regards as the most fundamental law of thought. For series of "homogeneously related terms," the law is that "*skipping intermediary terms leaves the relations the same.*" The factor of transitivity enters the picture when James distinguishes between relations which are and relations which are not *transferable*. "All skipping of intermediaries and transfer of relations occurs within homogeneous series," he writes. "But not all homogeneous series allow of intermediaries being skipped. It depends on which series they are, on what relations they contain. Let it not be said that it is a mere matter of verbal association, due to the fact that language sometimes permits us to transfer the *name* of a relation over skipped intermediaries, and sometimes does not; as where we call men 'progenitors' of their remote as well as of their immediate posterity, but refuse to call them 'fathers' thereof. There are relations which are *intrinsically* transferable, whilst others are not. The relation of *condition*, e.g., is intrinsically transferable. What conditions a condition conditions what it conditions—'cause of cause is cause of effect.' The relations of negation and *frustration*, on the other hand, are not transferable: what frustrates a frustration does not frustrate what it frustrates. No changes in terminology would annul the intimate difference between these two cases."

THE FOREGOING PASSAGES from James reflect the general tenor of the theory of the calculus of relations. He himself does not systematically expound it. Its elaboration is to be found in the writings of Boole, Couturat, and De Morgan, of Jevons, Pierce, Bradley, Royce, Russell and Whitehead (whose works are cited in the Additional Readings). Is this relational logic more general than the subject-predicate logic that is traditionally called "Aristotelian," or is the reverse the case?

The modern answer insists upon the greater generality of relational logic. Royce, for example, defining "subsumption" as a non-symmetrical, transitive relation which obtains between two classes when one includes the other, declares that "the entire traditional 'theory of

the syllogism' can be expressed as a sort of comment upon, and relatively simple application of, the transitivity of the subsumption relation." According to Royce, William James' axiom of skipped intermediaries represents a step in the right direction, but it fails to achieve complete generality.

Russell disposes of the traditional theory of the proposition in the same fashion that Royce disposes of the traditional theory of the syllogism. Traditional logic, he writes, "believed that there was only one form of simple proposition (*i.e.*, of proposition not stating a relation between two or more other propositions), namely, the form which ascribes a predicate to a subject." It is, therefore, "unable to admit the reality of relations; all relations, it maintains, must be reduced to properties of the apparently related terms." Russell insists, on the contrary, that "propositions stating that two things have a certain relation have a different form from subject-predicate propositions." This can be most easily seen, he thinks, in the case of asymmetrical relations. The proposition which states that A and B are related by the symmetrical relation of equality, "can be interpreted to mean that A and B both possess a common property. "But when we come to asymmetrical relations, such as before and after, greater and less, etc., the attempt to reduce them to properties becomes," in Russell's opinion, "obviously impossible." The relational theory of the proposition, therefore, includes the subject-predicate theory as a special case.

A defense of the subject-predicate logic would not make the counterclaim that relational logic can be treated as a special case. Rather it would insist that the two logics are radically different in principle—that the one belongs to a philosophy of nature and a metaphysics, in which substance is the primary concept; whereas the other belongs to the empirical sciences and to modern mathematics, in which the concept of relation supplants substance. Whichever side of the controversy is taken, the undeniable difference between a relational and a subject-predicate logic represents one of the great differences between modern and ancient thought.

It is not only in logic that the modern emphasis seems to be upon relations rather than

upon things related—on relations denuded of their terms rather than on terms treated as correlatives. The same tendency appears in modern mathematics, in algebra, in the calculus, and especially in the theory of equations and functions, of sets and series. It also appears in modern physics where, according to Cassirer, the great conceptual revolution consists in displacing substance by function, and the casual interaction of substances by functional relationships and systems of order. Such substitutions obviously parallel the shift in logic—from the consideration of terms related as subjects and predicates, to the consideration of relations without regard to differences in the terms related.

In the tradition of the great books, this conceptual revolution seems to be announced by the treatment which *Plato* and Kant accord to the notion of substance. Hume appeals to conceive of experience as a series of events related, as he says, by “only three principles of connexion . . . namely, *Resemblance*, *Contiguity* in time or place, and *Cause or Effect*.” These relations make up the fabric of experience. So long as it consisted in such connections, our experience would be the same whether or not there were enduring things or substances.

“Nature has established connexions among particular ideas,” Hume writes, so that “no sooner does one idea occur to our thoughts than it introduces its correlative.” All our knowledge of matters of fact depends upon the association of ideas, or the relations of resemblance, contiguity, and causation among the elements of experience. All other knowledge has for its object those relations between ideas which do not connect them causally or place them in a spatial or temporal order. In either case, relations of all sorts, rather than things and their properties (or substances and their attributes), seem to be the prime constituents of nature and of knowledge.

Kant presents a fourfold classification of judgments according to their quantity, quality, relation, and modality. Under the head of relation, he distinguishes the categorical, the hypothetical, and the disjunctive according to the following criteria: “*a*. Relation of the predicate to the subject. *b*. Relation of the cause to its effect. *c*. Relation of subdivided knowledge,

and of the collected members of the subdivision to each other.” These are, he writes, “all the relations of thought in judgements.”

Pointing out that he borrows the term from Aristotle, Kant calls the pure concepts of the understanding “categories” and constructs a table of categories which runs parallel to his table of judgments; because, as he explains, “the same function which imparts unity to various representations in one judgment imparts unity likewise to the mere synthesis of various representations in one intuition, which in a general way may be called the pure concept of understanding.” Kant’s categories, in contrast to Aristotle’s, afford a striking example of the shift from substance to relation.

Where for Aristotle substance is the primary category and all other categories signify the accidents of substance, among which relation seems to have least reality in the nature of things, Kant makes relation one of the four major groups of categories, and under relation places subsistence and inherence (or substance and accident) along with causality and dependence (or cause and effect) and community (or reciprocity between the active and the passive). It is not substance, but the relation of substance and accident, which is for Kant a transcendental category.

THE ISSUE CONCERNING substance and relation takes another form in the problem whether relations exist *in* the very nature of things as belonging to their essence, or only exist as connections *between* things. In the latter alternative, there is still the question whether relations between things are externally affixed to them or are internally inherent in them and affect the natures of the things related.

According to the Christian doctrine of the Trinity, there are real relations *in* God, each really distinct from the others, yet each identical with the divine essence. These relations are the persons of the Trinity—the relations Aquinas calls “paternity, filiation, spiration and procession,” the relation of the Father and the Son, and of the Holy Spirit to them both. “Relation in God,” he writes, “is not as an accident in a subject, but is the divine essence itself; and so it is subsistent, for the divine essence is subsistent. Therefore, as the Godhead

is God, so the divine paternity is God the Father, Who is a divine person. Therefore, a divine person signifies a relation as subsisting."

Since the three persons of the Trinity are of the same essence, the principle of their real distinction must be found elsewhere. Denying that "there can be discerned between them a real distinction in respect of the divine essence," Descartes does not reject the possibility of a distinction "in respect of their relation to one another." Aquinas considers "two principles of difference among the divine persons . . . *origin* and *relation*," but thinks it is "better to say that the persons or hypostases are distinguished by relations rather than by origin"; for, among other reasons, "when a relation is an accident, it presupposes the distinction of subjects; but when the relation is subsistent, it does not presuppose, but brings about, distinction."

It would seem to follow that, except in God, relations are not subsistent. In Aristotle's theory of corporeal substances, for example, the matter and the form which constitute a physical thing are united, not related. Though matter and form are conceived as really distinct principles in the composition of a composite substance—as essence and existence are also sometimes said to be really distinct principles in the being of all things except God—their real distinction does not imply that they are subsistent, as are the persons of the Trinity, nor that they are relations, or in relation to one another. If real as opposed to logical relations occur only between things which somehow really subsist, then those principles which must be united in order for a thing to subsist cannot be really related to one another.

WITH A SOMEWHAT different analysis, Locke seems to exclude relations from the constitution of what he calls "the complex idea of substance." All complex ideas, according to Locke, "are either modes, substances, or relations." The complex idea of substance is a "collection of those several simple ideas of sensible qualities, which we . . . find united in the thing called horse or stone; yet because we cannot conceive how they should subsist alone, nor one in another, we suppose them existing in, and supported by some common subject; which support we denote by the name substance,

though it be certain we have no clear or distinct idea of that thing we suppose a support."

The various simple ideas of qualities which, together with the indistinct notion of a supporting substratum, constitute the complex idea of a particular substance, are, in Locke's theory, compounded, not related. Relation is itself a complex idea, consisting in "the consideration and comparing of one idea with another." The ideas related may be either simple or complex, but the relations are *between* ideas, not *in* them—certainly not in simple ideas, nor in complex ideas of modes and substances, which are combinations, not relations, of simple ideas.

The exception is, of course, a complex idea of relation, which involves several distinct ideas and, in addition, the idea of a relation between them which, Locke says, "it gets from their comparison one with another. . . . Since any idea, whether simple or complex, may be the occasion why the mind thus brings two things together . . . any of our ideas may be the foundation of relation"; but, Locke adds, "there must always be in relation two ideas, or things, either in themselves really separate, or considered as distinct, and then ground or occasion for their comparison."

Locke's theory of relations not only seems to exclude them from the interior constitution of substances, but also seems to make them entirely extrinsic to the natures of the things related. "Ideas of relation," Locke says, "may be the same in men who have far different ideas of the things that are related or that are thus compared." The relation is unaffected by the things it relates, as they in turn are unaffected by it, for they are "not contained in the real existence of things, but [are] something extraneous and super-induced."

Berkeley and Hume also seem to agree that relations are entirely external. "Relations are distinct from the ideas or things related," writes Berkeley, "inasmuch as the latter may be perceived by us without our perceiving the former." To Hume, "all events seem entirely loose and separate. One event follows another; but we can never observe any tie between them. They seem *conjoined*, but never *connected*." So far as our understanding goes, nothing in the nature of one event necessarily

leads the mind to the consideration of another, as it would if the event could not be understood by us except as intrinsically related or connected with that other.

In the tradition of western thought, the issue concerning the internality or externality of relations has profound implications for man's conception of the order of nature or the structure of the world. The difference, discussed in the chapter on CHANCE, between what William James calls the "block" and the "concatenated" universe presupposes not only different views of causality, but also different positions with respect to the internality or externality of relations, as is indicated by James' criticism of Hegel and Bradley.

The relation of part and whole, and of one part to another in the structure of an organic whole, seems to be the prime example of internal relationship. Each part is thought to be constituted, both in its being and nature, by the being and nature of the whole to which it belongs and by the other parts which comprise that whole. This may be seen in Spinoza's theory of God or Nature as the one and only substance, in and through which everything else both is and is conceived. All things are locked together in a system of internal relationships—the finite parts with one another through the infinite whole which determines each to be what it is, in itself and in relation to all others.

RELATION SEEMS TO BE the principle of order. At least it can be said that the various conceptions of order which appear in the great books involve the idea of relation and of different kinds of relationship.

The order of the universe or of nature, for example, seems to be differently conceived according as things are causally related to one another, related as lower and higher species in a hierarchy of grades of being, or as the parts of one all-embracing whole. In each case, it makes a difference, as we have already observed, whether the relations involved are thought to be real or logical, and internal or external to the things related.

Relation similarly enters into conceptions of psychological, political, and moral order—the order of the parts of the soul, the order of classes or functions in the state, the order of

goods, of means and ends, of duties, of loves. Just as the status of each thing in nature is affected by whether the universe is conceived as a whole of internally related parts or as a set of externally related wholes, so the status of the individual in society is affected by whether the state is conceived as an organic whole or merely as a political order formed by the free association of individuals.

The consideration of the various types of order occurs in other chapters, such as NATURE, WORLD, SOUL, STATE, GOOD AND EVIL, and BEAUTY. Particular types of relationship are also discussed in chapters concerned with the terms between which such relationships hold—the relation of cause and effect in the chapter on CAUSE; spatial and temporal relationships in the chapters on SPACE and TIME; the relation of species and genus in the chapters on EVOLUTION and IDEA; relations of equality and inequality in the chapter on QUANTITY; and relations of similarity and dissimilarity in the chapter on QUALITY.

This last type of relationship, more broadly conceived as including not merely likeness in quality, but the sameness or similitude of things in every sort of respect, is the main consideration of the chapter on SAME AND OTHER. The theory of analogy is discussed there also, for though it is concerned with relation—a proportion being a ratio of ratios—the specific relationship by which relations are themselves related in analogies or proportions seems to be one of similitude (either identity or similarity).

Finally, the idea of relation seems to be involved in the contrast between the absolute and the relative. Things are said to be considered absolutely when they are considered in themselves, and relatively when they are considered with reference to something else. By extension of these meanings, relativism tends to assert that with regard to most things, if not all, what they are depends on the point of view, *i.e.*, their relation to man, to *this* group of men, or even to *this* man. Absolutism goes to the opposite extreme of saying that things are what they are independently of man's view of them. The opposition of these two tendencies creates familiar issues concerning the true, the good, and the beautiful, which are discussed in the chapters devoted to those subjects.

OUTLINE OF TOPICS

	PAGE
1. The general theory of relation	577
1a. The nature and being of relations: the distinction between real and logical or ideal relations	
1b. The effect of relations on the nature and being of things: internal and external relations	
1c. The coexistence of correlatives	578
1d. Relational unity or identity of relation: the notion and use of analogy or proportionality	
2. Order and relation in God: the divine processions and the relations constituting the Trinity of persons	
3. The relation of God to the world: divine immanence and transcendence	579
4. Relation in the order of thought or knowledge	
4a. The definability or indefinability of relative terms	
4b. The proposition or judgment as a statement of relation: relation in reasoning	
4c. The transcendental categories of relation	
4d. Relations as objects of knowledge: ideas of relation	
4e. The relations between ideas	580
4f. The types of relationship underlying the association of ideas in thought, memory, and dreams	
5. Order as a system of relationships or related things	
5a. The nature and types of order: inclusion and exclusion; succession and coexistence; priority, posteriority, and simultaneity	
(1) The order of the causes or of cause and effect	581
(2) The order of goods or of means and ends: the order of loves	582
(3) The order of quantities: the types of proportion	
(4) The order of kinds: hierarchy; species and genus	583
5b. The order of the universe or of nature: the hierarchy of beings	
5c. Order as a principle of beauty	584
6. The absolute and the relative modes of consideration	
6a. Absolute and relative with respect to space, time, motion	585
6b. Absolute and relative with respect to truth	
6c. Absolute and relative with respect to goodness or beauty	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER *Iliad* BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS. When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES *Psychology* 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page; the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO *Symposium* 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS. One or more of the main divisions of a work (such as PART, BOOK, CHAPTER, SECTION) are sometimes included in the reference; line numbers, in brackets, are given in certain cases. e.g., *Iliad* BK II [265-283] 12d.

BIBLICAL REFERENCES. The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows. e.g., OLD TESTAMENT *Nehemiah*, 7:45 (D) *II Esdras* 7:46.

SYMBOLS. The abbreviation 'esp.' calls the reader's attention to one or more especially relevant parts of a whole reference. 'passim' signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 79: RELIGION

INTRODUCTION

ARGUMENT is unprofitable—worse than that, unintelligible—when opponents do not share some common ground. Between the complete skeptic who denies reason's competence and the philosopher or scientist who appeals to it, no common ground exists. Between the man who obeys the rule not to contradict himself and the man who finds nothing repugnant in answering Yes and No to the same question, there can be no argument. There is an issue between them, but the position each takes reduces the other to silence.

Lack of a common measure for judging opposed views tends to render them incommunicable to one another. For men to be in this plight is the exception in science and philosophy, but it seems to be the typical situation where the basic issues of religion are concerned. Of all subjects the most controversial, religious issues seem to be the least capable of being settled by controversy. No divisions among men—certainly not those which separate philosophers or scientists—are as unbridgeable as the chasm between the faithful and those they call infidels, between Jew and gentile, or Christian and pagan. Faith and lack of faith, or the diversity of faiths, seem to render certain questions as imponderable as they are weighty.

On the definition of religion itself, the deepest issue lies between those who conceive it as having a supernatural foundation in God's revelation and authority, and those who think of religion as having a purely natural origin in certain human tendencies, which makes it no different from philosophy and science as an element of culture. But religion can be supernatural only for those whose faith declares it to be so. Those who deny that it is supernatural may offer many reasons for thinking so, and try in many ways to explain away faith. What they all come to is that it is an illusion to suppose faith

is God's gift rather than man's own will to believe. To the man of faith this only means that his critic lacks the gift of faith or even the wish to have it.

Many consequences follow from this unarguable difference concerning the meaning of religion. Religion to the man of faith usually means much more than the acceptance of a creed. It means acts of piety and worship, recourse to prayer, the partaking of sacraments, the observance of certain rituals, the performance of sacrifices and purifications. It means rendering to God what is His due, obeying His commandments, beseeching and gaining the help of His grace, whereby to lead a life which shall seem worthy to Him. When religion is conceived as nothing more than a set of beliefs which men have adopted, it is restricted to one part of life. It may or may not involve action as well as thought, but it is not the fabric of a whole life. It does not qualify every other part of it. It does not demand that inner devotion and external conduct constitute the practice of a man's belief if he is to avoid hypocrisy.

ACCORDING TO THIS difference in the conception of religion as supernatural or natural, men seem to hold incommunicably different views of religious belief, of revelation, miracles, and prophecies. But those who agree that religion is not man-made, that it requires, in some form, divine authority and inspiration, do not all have the same faith, worship in the same way, or conform to the same rites. The issue, therefore, between men of different faiths—men who live according to the rules of different religious communities—is almost as difficult as that between the religious and the irreligious.

In the western tradition, the plurality of religions necessarily raises a question of truth and falsity for any religionist whose faith excludes

the possibility of several equally true religions. "Idolatrous" and "superstitious," "heretical" and "schismatic," are epithets which draw their special significance from controversies about religion and religions. The word "pagan," as Gibbon points out, comes to mean idolatry or the worship of false gods. "The Latin Christians," he says, "bestowed it on their mortal enemies, the Mahometans." The Mohammedans, in turn, held the view, according to Gibbon, that "all except themselves deserved the reproach of idolatry and polytheism." The charges of idolatry and superstition occur also in the conflict between Jew and Christian, between Protestant and Catholic, countered often by charges of infidelity or heresy and schism.

Quite apart from the general problem of church and state, with its issues of political toleration and freedom of worship, the very meaning of religion raises the question of tolerance in its most acute form. It is not a question of political rights and liberties, but of being right or wrong in one's religious beliefs and acts. To the extent that the communicants of one religion regard themselves as believing what God has revealed to them, and to the extent that they hold their religious practices to be prescribed by divine law, they are not free in conscience, it seems, to entertain contrary beliefs and practices as conceivably true alternatives.

The conflict between men of diverse faiths, alike in their understanding of faith as divinely inspired, somehow appeals beyond any human decision to God himself for judgment. The controversy between men of any religious faith and those who treat such faith as a purely human prejudice seems to be even less susceptible of resolution by the ordinary processes of discourse.

IF THESE OBSERVATIONS are accurate and just, the materials of this chapter cannot be assembled dialectically—either as opposed views or as belonging together—simply by reference to the content of the various opinions which can be found in the great books. In this chapter, as in no others except, perhaps, those which treat of matters connected with religion—such as GOD, IMMORTALITY, SIN, and THEOLOGY—it seems necessary to pay some attention to the opinion's author as well as to the opinion, and

even in some cases to the community or culture in which the opinion arises. It is not as necessary, for example, to know whether the man who writes about virtue is himself virtuous as it is to know whether the man who writes about religion is religious and to know furthermore in what sense he conceives himself as being religious and what religion he espouses.

The distinction between sacred and profane, and between religious and secular, applies to books as well as to other things. In the tradition of the great books, only one book is set apart as sacred. None of the writers included in this set regard the Koran as sacred scripture, though Gibbon as an historian reports the Mohammedan belief in the Koran. Mohammedans believe that the Koran is the word of God revealed to His one and only prophet, as Jews believe that the Old Testament is divinely inspired writing, and Christians believe in both Testaments as Holy Writ.

But though the Bible is *the* traditionally sacred book of the west, it is not read as such by all who write about it. The historian or the philosopher who is not himself a religious Jew or Christian may acknowledge the belief of others without sharing it. He reads the Bible as a collection of human writings which have exercised an unparalleled influence upon western culture. Whatever the merit of these writings as wisdom, history, preachment, or poetry, they do not command a special kind of reading unless they are distinguished from all others by being the word of God, not man. Controversies over interpretations of the Bible may thus begin with each side begging the main question in issue. Is the Bible sacred scripture, or is it no different in kind from the poetry of Homer and the sayings of the Greek wise men?

The two ways of reading the Bible are incommensurable. If the Bible is not sacred, a critical reading may be expected to disclose inconsistencies in it, and many of the things it says may be questioned in fact or in principle. But if, though humanly recorded, it is the repository of divine revelation, then it has an authority which puts it above questioning, though not beyond the need for interpretation.

There is one sort of proposition, says Locke, which challenges "the highest degree of our assent upon bare testimony, whether the thing

proposed agree or disagree with common experience, and the ordinary course of things, or no. The reason whereof is, because the testimony is of such a one as cannot deceive, nor be deceived, and that is of God himself. This carries with it an assurance beyond doubt, evidence beyond exception. This is called by a peculiar name, revelation; and our assent to it, faith: which as absolutely determines our minds, and as perfectly excludes all wavering, as our knowledge itself; and we may as well doubt of our own being, as we can whether any revelation from God be true. So that faith is a settled and sure principle of assent and assurance, and leaves no manner of room for doubt or hesitation. Only we must be sure that it be a divine revelation, and that we understand it right."

Locke seems to be putting two qualifications upon his remark that "the bare testimony of revelation is the highest certainty." The first concerns our assurance that we are not mistaken in accepting something as revealed. The second concerns the correctness of our understanding of that which we take to be God's word.

On the first point, Hobbes, though he says that "faith is a gift of God, which man can neither give nor take away by promises of rewards or menaces of torture," also says that faith depends "only upon certainty or probability of arguments drawn from reason or from something men believe already." Faith does not come "by supernatural inspiration or infusion" but, according to Hobbes, "by education, discipline, correction, and other natural ways, by which God worketh them in his elect, at such time as he thinketh fit." The object of faith is not God, but the men whom God has appointed to instruct us; belief, which Hobbes distinguishes from faith, goes beyond faith to the acceptance as true of what they say. "Consequently," Hobbes writes, "when we believe that the Scriptures are the word of God, having no immediate revelation from God himself, our belief, faith, and trust is in the Church, whose word we take, and acquiesce therein."

On this same point, Aquinas gives a different answer. He distinguishes between the material and the formal aspects of the object of faith. As in the object of science, so in the object of faith there is "that which is known . . . and is the

material object, so to speak," and "that whereby it is known, which is the formal aspect of the object. Thus, in the science of geometry, the conclusions are what is known materially, while the formal aspect of the science consists in the means of demonstration, through which the conclusions are known. Accordingly, if in faith we consider the formal aspect of the object, it is nothing else than the First Truth. For the faith of which we are speaking does not assent to anything, except because it is revealed by God." The articles of religious faith may be drawn from the content of Holy Writ, but that Holy Writ is the revealed truth of God must first be accepted by an act of faith. Aquinas seems to be meeting Locke's point by saying that it is faith itself which makes us sure that the propositions to which we assent by faith are the matter of divine revelation.

ON LOCKE'S OTHER point concerning the rightness of our interpretation of Scripture, Locke himself remarks that "though everything said in the text be infallibly true, yet the reader may be, nay, cannot choose but be, very fallible in the understanding of it. Nor is to be wondered that the will of God, when clothed in words, should be liable to that doubt and uncertainty, which unavoidably attends that sort of conveyance." From which he concludes that since "the precepts of natural religion are plain, and very intelligible to all mankind, and seldom come to be controverted; and other revealed truths, which are conveyed to us by books and languages are liable to the common and natural obscurities incident to words, methinks it would become us to be more careful and diligent in observing the former, and less magisterial, positive, and imperious, in imposing our own ideas and interpretations of the latter."

That Scripture is difficult to interpret and subject to various interpretations Augustine also acknowledges, but he differs somewhat from Locke concerning the task or duty which that fact imposes upon the religious man. "Let no one then go on bothering me," Augustine writes, "with such words as 'Moses did not mean what you say, he meant what I say.' If he said to me: 'How do you know that Moses meant by these words what you say?'—I should

take the question with complete calmness. . . . But when he says: 'He did not mean what you say, he meant what I say,' yet does not deny that what each of us says is true, then, O Life of the poor, O my God, in whose bosom is no contradiction, rain down the gift of moderation upon my heart, that I may hear such talk with patience. For what they say, they say not because they are godly men and have seen it in the mind of Your servant Moses, but because they are proud men: it is not that they know the opinion of Moses, but that they love their own opinion, and this not because it is true but because it is their own."

Confronted by a variety of interpretations, each of which may be true, Augustine remarks "how foolish it is, in such a flood of true meanings . . . rashly to assert that Moses intended one or the other of them. . . . If I had been Moses . . . if I had been the same as he and You had given me the book of Genesis to write, I should have wished that You would grant me such skill in writing, such an art for the construction of what I had to say, that not even those who cannot yet grasp how God creates would reject my words as too much for their strength; and again that those who can grasp so much, would find fully contained in the few words of Your servant whatever truths they had arrived at in their own thinking." Those "who thirst for truth and not for vanity" honor the human dispensers of God's revelation, Augustine thinks, by believing that, when under God's inspiration they wrote these words, they "had in mind whatever is most excellent in them by the illumination of truth and their fruitfulness for our profit.

"Thus when one man says to me: 'Moses meant what I think,' and another 'Not at all, he meant what I think,' it seems to me," Augustine declares, "that the truly religious thing is to say: Why should he not have meant both, if both are true; and if in the same words some should see a third and a fourth meaning and any other number of true meanings, why should we not believe that Moses saw them all, since by him one God tempered Sacred Scripture to the minds of many who should see truths in it, yet not all the same truths."

Augustine's position combines belief in the truth of Scripture, which is a consequence of

the faith that it is God's word, with latitude of interpretation in determining what that truth is, appealing here to the ordinary standards of what seems to be true to the thinking mind. In the course of commenting on Augustine's own interpretation of certain passages in Genesis, Aquinas summarizes what he takes to be Augustine's two rules. "The first is, to hold the truth of Scripture without wavering. The second is that since Holy Scripture can be explained in a multiplicity of senses, one should adhere to a particular explanation only in such measure as to be ready to abandon it, if it be proved with certainty to be false; lest Holy Scripture be exposed to the ridicule of unbelievers, and obstacles be placed to their believing."

AS THE QUESTION whether the Bible is sacred writing affects the way it is to be read, so the distinction between religious and secular writing seems relevant to what the great books have to say about religion.

In the pagan tradition, for example, Herodotus in his *History* reports and discusses a great variety of religious doctrines and practices as characteristic of the peoples he visits or inquires about. There seems to be no indication that Herodotus is judging the truth or falsity of these various religions, either by reference to their reasonableness or from convictions born of his own adherence to one of these religions as against all the rest. For the most part, he is writing *about* religion rather than *religiously*, with the possible exception of those passages in which he expresses his own views, discussed in the chapter on PROPHECY, on the oracles, omens, and portents which reveal the will of the gods.

In contrast, the tragedies of Aeschylus, especially the Oresteian trilogy, are religious poetry, comparable to Dante's *Divine Comedy* and Milton's *Paradise Lost*. These are not books *about* religion, as, in a sense, the great poem of Lucretius *On the Nature of Things* is about religion—a passionate attack on religion by a man who is not religious. It may be thought that the aim of Lucretius is to purify religion when he wishes to banish "all belief in things degrading to the gods and inconsistent with their peace," so that men can "approach the sanctuaries of the gods with a calm breast," and "with tranquil peace of mind." But even a person who

thinks this will still find a marked contrast between Lucretius and poets like Aeschylus or Dante who are writing from religious convictions to which they adhere as members of a religious community.

Both kinds of writing may be found in the same author. Hobbes, for example, in examining the phenomena of religious belief, seems to make public acceptance the criterion of the distinction between religion and superstition. "Fear of a power invisible, feigned by the mind," he says, "or imagined from tales publicly allowed," is religion; when they are "not allowed, superstition." Still writing as an observer, he says that "this fear of things invisible is the natural seed of that which everyone in himself calls religion; and in them that worship or fear that power otherwise than they do, superstition." Originating from "natural seeds" which he enumerates, "religion," he says, "by reason of the different fancies, judgments, and passions of several men, has grown up into ceremonies so different, that those which are used by one man are for the most part ridiculous to another."

Yet Hobbes also writes religiously, when he treats all other religions from the standpoint of the special truth of his own. "These natural seeds of religion," he points out, "have received culture from two sorts of men. One sort have been they that have nourished and ordered them, according to their own invention. The other have done it by God's commandment and direction. . . . Of the former sort were all the founders of commonwealths and the law-givers of the Gentiles. Of the latter sort were Abraham, Moses, and our Blessed Saviour, by whom have been derived unto us the laws of the Kingdom of God."

It is as a Christian that Hobbes compares the state religion of the Romans with the divine religion of the Jews. The Romans, he writes, "made no scruple of tolerating any religion whatsoever in the city of Rome itself, unless it had something in it that could not consist with their civil government; nor do we read that any religion was there forbidden, but that of the Jews, who (being the peculiar Kingdom of God) thought it unlawful to acknowledge subjection to any mortal King or State whatsoever. And thus you see how the religion of the Gentiles was a part of their policy.

"But where God himself," Hobbes continues, "by supernatural revelation, planted religion; there he also made to himself a peculiar kingdom, and gave laws, not only of behavior toward himself, but also toward one another; and thereby in the Kingdom of God, the policy, and laws civil, are a part of religion; and therefore, the distinction of temporal and spiritual domination has there no place."

Again it is as a man of Christian faith that Hobbes ascribes belief in Christian teachings to that faith. "The causes why men believe any Christian doctrine are various," he writes. "For faith is the gift of God, and he worketh it in each man by such ways as it seemeth good to him. The most ordinary immediate cause of our belief, concerning any point of Christian faith, is that we believe the Bible to be the Word of God." But when Hobbes goes on to say that the "only article of faith, which the Scripture makes necessary to salvation, is this, that Jesus is The Christ," he becomes the theologian with whom other theologians within the Christian community may disagree, on this or other points of dogma.

The disagreements we find between Augustine or Aquinas and Hobbes or Locke, or the differences in dogma which appear in a comparison of the *Divine Comedy* and *Paradise Lost*, represent the division between Catholic and Protestant Christians. But such theological disagreements do not obliterate certain common tenets of religious belief among all who profess Christianity. Above all, they leave untouched the belief in religion itself as transcending all merely human teaching and as providing the precepts of life through which God himself directs and helps man to his salvation.

This belief—even if no other except the belief in one God Who created the universe and made man in His image—seems to be shared by Jews and Christians. It marks the difference between the religious writings of ancient polytheism and of those which draw their inspiration from the Pentateuch and the Gospels. It makes the issue, as Pascal suggests, between those who write about a religion which they themselves either have or seek, and those who, neither having nor seeking, oppose all religions equally or treat all with the same secular detachment.

WRITING AS A CHRISTIAN apologist, Pascal says that "it is the glory of religion to have for enemies men so unreasonable; and their opposition to it is so little dangerous that it serves on the contrary to establish its truths. For the Christian faith goes mainly to establish these two facts, the corruption of nature, and redemption by Christ. Now I contend that if these men do not serve to prove the truth of the redemption by the holiness of their behavior, they at least serve admirably to show the corruption of nature by sentiments so unnatural.

"Let them at least be honest men," he adds, "if they cannot be Christians. . . . Let them recognize that there are two kinds of people one can call reasonable: those who serve God with all their heart because they know Him, and those who seek Him with all their heart because they do not know Him. But as for those who live without knowing Him and without seeking Him, they judge themselves so little worthy of their own care, that they are not worthy of the care of others; and it needs all the charity of the religion which they despise, not to despise them even to the point of leaving them to their folly."

The very existence of other religions, according to Pascal, helps to prove the truth of the Christian religion. "I should equally have rejected the religion of Mahomet and of China, of the ancient Romans and of the Egyptians, for the sole reason, that none having more marks of truth than another, nor anything which should necessarily persuade me, reason cannot incline to one rather than the other." As for Judaism, it seems to Pascal to be divinely intended as the historic foundation and the prophetic forerunner of Christianity.

Apart from these comparative judgments, Pascal attributes certain unique signs of truth to the Christian religion. "Every religion is false," he writes, "which as to its faith does not worship one God as the origin of everything, and which as to its morality does not love only God as the object of everything. . . . The true religion must have as a characteristic the obligation to love God. This is very just, and yet no other religion has commanded this; ours has done so. It must also be aware of human lust and weakness; ours is so. It must have adduced remedies for this; one is prayer. No other reli-

gion has asked of God [the power] to love and follow him. . . . That we must love one God only is a thing so evident, that it does not require miracles to prove it." Yet Pascal also interprets Christ's saying, "Though you believe not Me, believe at least the works," as meaning that miracles are the strongest proof of a religion. "Miracles," he writes, "furnish the test in matters of doubt, between Jews and heathens, Jews and Christians, Catholics and heretics, the slandered and slanderers, between the two crosses."

After criticizing the evidence for miracles on rational grounds, Hume appears to agree that "the *Christian religion* not only was at first attended with miracles, but even at this day cannot be believed by any reasonable person without one." But his meaning seems to be that belief in miracles is itself the miracle of faith. "Mere reason," he says, "is insufficient to convince us" of the veracity of the Christian religion; "and whoever is moved by *Faith* to assent to it, is conscious of a continued miracle in his own person, which subverts all the principles of his understanding, and gives him a determination to believe what is most contrary to custom and experience."

HERE IS ANOTHER ISSUE on which philosophers and theologians disagree. Where Hume says that "our most holy religion is founded on *Faith*, not on reason"—with the further implication that to adhere to it with faith requires the abandonment of reason—Augustine and Aquinas think that there can be no conflict between faith and reason, though faith declares the truth of more than reason can prove; and that the support which reason can give to faith in no way lessens the merit of believing.

With this Hobbes seems to agree, at least to the extent of holding that it discredits supernatural religion to make it consist in believing impossibilities or contradictions. Revelation, he says, can consist "of nothing against natural reason." But for Hume the difference between supernatural and natural religion turns on what one must believe both without and against reason as contrasted to what one believes as the result of a reasonable interpretation of the evidence. Like philosophy, natural religion, "which is nothing but a species of philosophy, will nev-

er be able to carry us beyond the usual course of experience, or give us measures of conduct and behavior different from those which are furnished by reflections on common life."

Those who, like Marx and Freud, regard religion as a social imposture or the response to a neurotic need, not only impute falsity or worse to the traditional religions of the west; they also tend to reject natural religion. Science is enough—for truth's sake, for the conduct of life, for society's welfare. Yet in commenting on the following lines from Goethe,

He who has Science and has Art,
Religion, too, has he;
Who has not Science, has no Art,
Let him religious be!

Freud says that "on the one hand, these words contrast religion with the two highest achievements of man, and on the other, they declare that in respect of their value in life, they can represent or replace each other." In these terms Freud thinks the religion of the ordinary man is justified—"the only religion that ought to bear the name." If a man does not have science or art to live by, he must have religion, for "life as we find it is too hard for us" and "we cannot do without palliative remedies."

It is the religion of the philosophers and the theologians which Freud questions. He criticizes the philosophers for trying "to preserve the God of religion by substituting for him an impersonal, shadowy, abstract principle"; and he challenges the grounds on which he thinks the theologians hold it to be "an impertinence on the part of science to take religion as a subject for its investigations." They deny that science has any competence whatsoever "to sit in judgment on religion. . . . If we are not deterred by this brusque dismissal," Freud declares, "but inquire on what grounds religion bases its claim to an exceptional position among human concerns, the answer we receive, if indeed we are honored with an answer at all, is that religion cannot be measured by human standards, since it is of divine origin, and has been revealed to us by a spirit which the human mind cannot grasp. It might surely be thought," he continues, "that nothing could be more easily refuted than this argument; it is an obvious *petitio principii*, a 'begging of the question.'

The point which is being called in question is whether there is a divine spirit and a revelation; and it surely cannot be a conclusive reply to say that the question cannot be asked because the Deity cannot be called in question."

Marx takes a similar view of the theologians. According to him, the theologians beg the question in much the same way as do the classical economists for whom there are "only two kinds of institutions, those of art and those of nature. Feudal institutions are artificial institutions, those of the bourgeoisie are natural institutions. In this," Marx says, "they resemble the theologians who establish two kinds of religion. Every religion but their own is an invention of men, while their own religion is an emanation from God."

Plato, on the other hand, excoriates those who think that "all religion is a cooking up of words and a make-believe." It is almost as if he had Marx and Freud in mind when, in the *Laws*, the Athenian Stranger carries on the discussion of religion in terms of the distinction between nature and art, and refers to those who "would say that the Gods exist not by nature, but by art, and by the laws of states, which are different in different places, according to the agreement of those who make them." They are the very same people who hold that "the honorable is one thing by nature and another by law, and that the principles of justice have no existence at all by nature."

IN PLATO'S VIEW, the justice of the state and its laws must be founded not only on nature rather than art, but also upon religion and a right belief in the gods. The Athenian Stranger answers those who think it is "dreadful that [we] should legislate on the supposition that there are Gods," by saying why "it is a matter of no small consequence . . . to prove that there are Gods, and that they are good and regard justice more than men do." The reason he gives is that "no one who in obedience to the laws believed that there were Gods, ever intentionally did any unholy act, or uttered an unlawful word, but those who did must have supposed one of three things—either that [the Gods] did not exist, which is the first possibility, or secondly, that if they did, they took no care of man, or thirdly, that they were easily appeased and turned aside

from their purpose by sacrifices and prayers." That is why the demonstration of the existence of the gods "would be the best and noblest prelude of all our laws."

Rousseau's legislator, like Plato's, is also concerned with the role which religion plays in the foundation and life of the state. But the question "Which religion?" arises at once for Rousseau, as it does not for Plato, who can treat the nature of the gods and the nature of the state as equally within the province of the political philosopher. But for Rousseau, living in a Christian civilization, the political philosopher cannot approach the subject of religion without being confronted by the theologian. He finds it necessary, therefore, to distinguish between a revealed religion like Christianity and the natural or civil religion of the citizen.

Christianity, says Rousseau, "not the Christianity of today, but that of the Gospel, which is entirely different," is the religion of man, not of the citizen. "So far from binding the hearts of the citizens to the State, it has the effect of taking them away from all earthly things. I know of nothing more contrary to the social spirit. We are told that a people of true Christians would form the most perfect society imaginable. I see in this supposition only one great difficulty: that a society of true Christians would not be a society of men. . . . The country of the Christian is not of this world."

What the state needs, Rousseau goes on to say, is "a purely civil profession of faith, of which the Sovereign should fix the articles, not exactly as religious dogmas, but as social sentiments without which a man cannot be a good citizen or a faithful subject." He then enumerates what he calls "the dogmas of civil religion" which "ought to be few, simple, exactly worded, without explanation or commentary," such as "the existence of a mighty, intelligent, and beneficent Divinity, possessed of foresight and providence, the life to come, the happiness of the just, the punishment of the wicked, the sanctity of the social contract and the laws."

Montesquieu takes the diametrically opposite view. "With regard to the true religion," he writes, "I have never pretended to make its interests submit to those of a political nature, but rather to unite them. . . . The Christian religion, which ordains that men should love each

other, would, without doubt, have every nation blessed with the best civil, the best political laws; because these, next to this religion, are the greatest good that men can give and receive." Montesquieu meets the argument that "true Christians cannot form a government of any duration," by saying that the more men "believe themselves indebted to religion, the more they would think due to their country. The principles of Christianity, deeply engraved on the heart, would be infinitely more powerful than the false honor of monarchies, than the human virtues of republics, or the servile fear of despotic states."

ANY CONSIDERATION OF the political significance of religion tends to lead into the controversy over the relation between church and state. Three main positions seem to be taken: one which calls for the integration of church and state, one which calls for a subordination of either state to church or church to state, and one which insists upon the autonomy of each as a basis for their relation to one another, or carries separation even further, to the point of complete divorce.

The theocratic state of the Old Testament represents the Jewish version of the first position, distinguished by the fact that the priesthood was in the service of the king. Hobbes defines a Christian commonwealth in almost parallel terms. It is indifferent whether it is called a "church" or a "state," because it is "a company of men professing Christian religion, united in the person of one sovereign." It follows, Hobbes argues, that "there is on earth, no such universal church as all Christians are bound to obey; because there is no power on earth, to which all other commonwealths are subject. There are Christians in the dominions of several princes and states; but every one of them is subject to that commonwealth, whereof he is himself a member; and consequently, cannot be subject to the commands of any other person. And therefore a church, such a one as is able to command, to judge, absolve, condemn, or do any other act, is the same thing with a civil commonwealth, consisting of Christian men; and is called a *civil state*, for that the subjects of it are *men*; and a *church* for that the subjects thereof are *Christians*."

According to Hobbes, "*temporal and spiritual* government are but two words brought into the world, to make men see double, and mistake their lawful *Sovereign*. . . . There is therefore no other government in this life, neither of state, nor religion, but temporal." Agreeing with Hobbes on the unity of government and the integration of church and state, writers like Augustine and Roger Bacon place kings in the service of the priesthood, and make the supreme pontiff, who governs both spiritually and temporally, the only earthly sovereign. Gilson summarizes their view by saying that for them "the definition of the Church includes the State," and that the church has a universality which embraces "the temporal and the spiritual domains alike."

The position of Aquinas is indicated in the *Treatise on Law*, in the passage in which he declares that no civil law can be valid or binding if what it commands is contrary to divine law. It is more explicitly developed in his little tract *On the Governance of Rulers*. "It is not the ultimate end," he writes, "of an assembled multitude to live virtuously, but through virtuous living to attain to the possession of God. Furthermore, if it could attain this end by the power of human nature, then the duty of a king would have to include the direction of men to this end." But, Aquinas holds, men attain this end by divine, not human, power and therefore divine, not human, government is needed to direct men to their end. "Consequently," he maintains, "in order that spiritual things might be distinguished from earthly things, the ministry of this kingdom has been entrusted not to earthly kings, but to priests, and in the highest degree to the chief priest, the successor of St. Peter, the Vicar of Christ, the Roman Pontiff, to whom all the kings of Christian peoples are to be subject as to our Lord Jesus Christ Himself. For those to whom pertains the care of intermediate ends should be subject to him to whom pertains the care of the ultimate end, and be directed by his rule."

This last statement indicates that Aquinas, unlike Augustine and Roger Bacon, assigns to the state a subsidiary dominion and to the king a subordinate jurisdiction. The opponent of Aquinas is usually thought to be Marsilius of Padua, whose *Defensor Pucis* separates church

and state, but subordinates priest to king, in a manner which corresponds to the Averroistic subordination of theology to philosophy. Agreeing with both that church and state are distinct, Dante agrees with neither on the relation which should obtain between the temporal and the spiritual domains, or between civil and ecclesiastical government.

Whereas Aquinas holds that only man's spiritual end is ultimate and that all temporal ends are intermediate, Dante insists that man has two ultimate goals. "Man exists for a double purpose," he says in *De Monarchia*. "Since he alone among beings partakes of both corruptibility and incorruptibility, he alone among beings belongs in two final orders—one of which is his goal as a corruptible being, the other as incorruptible." Man has two beatitudes, or two forms of happiness—an earthly perfection which consists in the complete realization throughout time of the intellectual powers of mankind, and a heavenly perfection which consists in the vision of God. "These two states of bliss," Dante argues, "like two different goals, man must reach by different ways. ~~For~~ we come to the first as we follow the philosophical teachings, applying them to our moral and intellectual capacities; and we come to the second as we follow the spiritual teachings, which transcend human reason according to our theological capacities, faith, hope, and charity."

In terms of this theory of man's two ends, and of the distinct spheres of reason and faith, or philosophy and civil law on the one hand, and religion and divine law on the other, Dante formulates his doctrine of the autonomy of state and church. "The reins of man," he writes, "are held by a double driver according to man's two-fold end: one is the supreme pontiff, who guides mankind with revelations to life eternal, and the other is the emperor, who guides mankind with philosophical instructions to temporal happiness." Church and state may be related as sun and moon in the sense that the state receives some illumination from the church even about matters within its own jurisdiction; but, according to Dante, the state has its own source of light in reason. "Temporal power," he maintains, "receives from spiritual power neither its being, nor its power or authority, nor even its functioning, strictly

speaking; but what it receives is the light of grace, which God in heaven and the pope's blessing on earth cause to shine on it in order that it may work more effectively."

All these mediaeval theories of what should be the relation between church and state—with the exception, perhaps, of the doctrine of Marsilius of Padua—conceive religion as having a supernatural source and the church as having a supernatural foundation, both being instituted for the sake of guiding man to his supernatural end. They differ from one another according to the view they take of man's earthly or temporal goods, the power of his reason, and the jurisdiction of his laws. Their difference, according to Gilson, verifies the principle that "the manner in which one conceives the relationship of the State to the Church, that in which one conceives the relationship of philosophy to theology, and in which one conceives the relationship of nature to grace, are necessarily correlated."

These mediaeval theories of church and state persist, with certain modifications, in modern times. But the characteristically modern view of the matter begins with a different view of religion itself. Its mediaeval prototype is to be found in the rationalism of Marsilius. Within the secular state, the church is a purely human institution, religion is defended by philosophy for the contribution it makes to the peace of the civil community—or, perhaps, condemned by the apostles of earthly progress as "the opiate of the masses." The principle of religious tolerance involves not merely tolerance of religion, but tolerance for a diversity of religions and often the complete rejection of all religion. "I esteem it above all things necessary," writes Locke in his *Letter Concerning Toleration*, "to distinguish exactly the business of civil government from that of religion, and to settle

the just bounds that lie between the one and the other. . . . The commonwealth," Locke continues, "seems to me to be a society of men constituted only for the procuring, preserving, and advancing their own civil interests." A church is "a voluntary society of men, joining themselves together of their own accord in order to the public worshipping of God in such manner as they judge acceptable to Him, and effectual to the salvation of their souls."

Locke's doctrine of the separation of church and state is reflected in the Constitution of the United States. In the form which Jefferson gives it, it appears in the declaration that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof." Mill carries out the same principles in his attack on "Sabbatarian legislation." Such laws, he thinks, exceed the power of civil government. They represent an "illegitimate interference with the rightful liberty of the individual. . . . The notion that it is one's duty that another should be religious" is, in Mill's opinion, "the foundation of all the religious persecutions ever perpetrated." Hegel, on the other hand, holds that "the state should require all citizens to belong to a church," but he points out that "a church is all that can be said, because since the content of a man's faith depends on his private ideas, the state cannot interfere with it."

The positions men take on the great issues of church and state thus seem to be determined in part by the diverse conceptions men have of religion. This is no less true of opposing views on religious liberty, on the treatment of heresy and schism, on religious education, the missionary calling, and the conversion of infidels. In the discussion of religion, perhaps more than anywhere else, the first Yea or Nay seems to determine all other affirmations or denials.

OUTLINE OF TOPICS

	PAGE
1. Faith as the foundation of religion	599
1a. The nature, cause, and conditions of faith: its specific objects	
1b. The sources of religious belief	600
(1) Revelation: the word of God and divine authority	
(2) Miracles and signs as divine confirmation	601
(3) The testimony of prophets: the anointed of God	602

	PAGE
2. The virtue and practice of religion: piety as justice to God	602
2a. Prayer and supplication: their efficacy	604
2b. Worship and adoration: the rituals and ceremonials of religion	605
2c. The nature, institution, and uses of the sacraments	606
2d. Sacrifices and propitiations	607
2e. Fasting and almsgiving	608
2f. Purificatory rites: the remission of sin by baptism and penance	609
2g. Profanations and sacrileges	
3. The religious life: religious offices and the religious community	610
3a. The Jewish conception of the religious community: the Torah and the Temple	
3b. The Christian conception of the church: the doctrine of the mystical body of Christ	611
3c. The nature and organization of the religious community	
(1) The institution of the priesthood and other ecclesiastical offices	
(2) Ecclesiastical government and hierarchy	613
(3) The support of ecclesiastical institutions: tithes, contributions, state subsidy	
3d. The monastic life: the disciplines of asceticism	
4. Church and state: the issue concerning temporal and spiritual power	614
4a. Religion in relation to forms of government: the theocratic state	615
4b. The service of religion to the state and the political support of religion by the state	
5. The dissemination of religion	
5a. The function of preaching	
5b. Religious conversion	616
5c. Religious education	
6. Truth and falsity in religion	617
6a. The religious condemnation of idolatry, superstition, and other perversions of worship	
6b. Religious apologetics: the defense of faith	618
6c. The unity and tradition of a religion	
(1) Orthodoxy and heresy: the role of dogma in religion; the treatment of heretics	
(2) Sects and schisms arising from divergences of belief and practice	619
6d. The relation of men of diverse faiths: the attitude of the faithful toward infidels	
6e. Religious liberty: freedom of conscience; religious toleration	620
6f. The rejection of supernatural foundations for religion: the criticism of particular beliefs and practices; the psychogenesis of religion	
6g. The relation between sacred doctrine and secular learning: the conflict of science and religion	621
7. Historical observations concerning religious beliefs, institutions, and controversies	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b 164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45 -(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 80: REVOLUTION

INTRODUCTION

MOST of the words commonly used as synonyms for "revolution," such as "insurrection," "uprising," "rebellion," or "civil war," carry the connotation of violence and the use of armed force. Most of the great revolutions in western history which come readily to mind—those in the city states and empires of the ancient world, the Peasants' Revolt in Germany in the 15th century, the rebellion led by Cromwell in 17th century England, the American and French Revolutions in the 18th century, the Russian and the Spanish Revolutions in our own time—have been affairs of bloodshed. Yet neither in political theory nor in historic fact does revolution always involve the use of force or the resort to violence.

Thucydides describes both violent and non-violent revolutions in the alternations of democracy and oligarchy in the constitution of the Greek city-states. In England, the Great Rebellion which, by civil war, succeeds in beheading one Stuart king, is followed by the Bloodless Revolution of 1688 which, without any war at all, unseats another. Some of the revolutions in the European states in the middle years of the 19th century are accompanied by barricades and fighting. Some, however, like the revolutions accomplished by the Reform Bills in England or by constitutional amendments in the United States, are fundamental changes in government effected by due process of law, by peaceful shifts in the distribution of political power.

A revolution may involve action in defiance of the law and yet be prosecuted without violence on the part of the revolutionists, as in the case of the rebellion which Gandhi led against British rule in India by the method of civil disobedience. The use of armed force may not, however, be the only technique of revolutionary violence. "Revolutions are effected in two ways," according to Aristotle, "by force and by

fraud." Though fraud does no physical violence, it does violence to the will of those who are deceived. In some cases when fraud is used, "the citizens are deceived into acquiescing in a change of government, and afterwards," Aristotle observes, "they are held in subjection against their will." In other cases, they may subsequently be persuaded and their allegiance and good will won. But as Machiavelli's later consideration of these two techniques of seizing power indicates, the choice between force and fraud is one of expediency rather than of principle. He recommends guile as an alternative to force, with force held in reserve should cunning fail. Both methods, however, employ the strategy of warfare.

As opposed to both force and fraud, and even to the method of civil disobedience, which acts outside the law or in violation of it, the writers of *The Federalist* conceive the possibility of a revolutionary process which is at once peaceful and legal. It is precisely because they think that the Constitution of the United States affords the opportunity for achieving political change by constitutional amendment that they defend the clause which guarantees "to every State in this Union a republican form of government," and promises to protect each of them, upon application to the federal government, "against domestic violence." To the objection that such a guaranty may involve "an officious interference in the domestic concerns of the members," Hamilton replies: "It could be no impediment to reforms of the State constitutions by a majority of the people in a legal and peaceable mode. This right would remain undiminished. The guaranty could only operate against changes to be effected by violence. Towards the prevention of calamities of this kind, too many checks cannot be provided."

In another of the *Federalist* papers, Madison

considers the possibility of "an insurrection pervading all the States, and comprising a superiority of the entire force, though not a constitutional right." He thinks such a case beyond "the compass of human remedies." It is enough if the Constitution "diminishes the risk of a calamity for which no possible constitution can provide a cure." Nor does "a conflagration through a whole nation, or through a very large proportion of it, proceeding either from weighty causes of discontent given by the government or from the contagion of some violent popular paroxysm" seem to Hamilton to "fall within any ordinary rules of calculation." In his estimation, "no form of government can always either avoid or control" such revolutions. But, he adds, "where the whole power of the government is in the hands of the people, there is the less pretence for the use of violent remedies in partial or occasional distempers of the State."

WHEN ARISTOTLE THINKS of revolutions as taking place without violence, he does not have in mind the strictly modern device of constitutional amendment. Political change, he suggests, may be the result of accidents rather than of planned actions. "Political revolutions," he writes, sometimes "spring from a disproportionate increase in any part of the state. . . . And this disproportion may sometimes happen by accident, as at Terentum, from a defeat in which many of the notables were slain in a battle with the lapygians just after the Persian War, the constitutional government in consequence becoming a democracy." Or "when the rich grow numerous or properties increase, the form of government changes into an oligarchy or a government of families."

On the other hand, to writers like Hobbes and Locke, revolution means war and is inseparable from violence. Those who "deny the authority of the Commonwealth"—apart from which, according to Hobbes, men live in a state of war—by renouncing their subjection to the Sovereign, "relapse into the condition of war commonly called Rebellion. . . . For rebellion is but war renewed." Unlike bees and ants, the peace of whose societies is never threatened by rebellion, there are "amongst men . . . very many that think themselves wiser, and abler to govern the public; better than the rest; and

these strive to reform and innovate, one this way, another that way; and thereby bring it into distraction and civil war."

Locke's principle seems to be that "whoever uses force without right—as everyone does in society who does it without law—puts himself into a state of war with those against whom he so uses it." Having entered into society "and introduced laws for the preservation of property, peace and unity amongst themselves," men who "set up force again in opposition to the laws, do *rebellare*--that is, bring back again the state of war—and are properly rebels."

Aquinas also seems to align revolution (which he calls "sedition") with war and strife, though he thinks it differs from them in two respects: "First, because war and strife denote actual aggression on either side, whereas sedition may be said to denote either actual aggression or the preparation for such aggression. . . . Secondly, they differ in that war is, properly speaking, carried on against external foes, being as it were between one people and another, whereas strife is between one individual and another, while sedition, in its proper sense, is between the mutually dissentient parts of one people, as when one part of the state rises in tumult against another part."

THOUGH THE WORD "revolution" may be used in both senses, it nevertheless seems to be the case that traditional discussions of the causes and prevention of revolution, theories of revolutionary strategy and tactics, and the great issue of the right of rebellion all seem to contemplate the resort to, or at least the threat of, force to gain an end. This also seems to be implied in the popular conception of the difference between revolution and evolution.

The contrast between revolution and evolution may explain why the note of violence, disorder, or disruption colors the idea of revolution. The word "evolution" usually signifies change which is gradual and which tends in one direction rather than another, that direction being for the most part toward a progressive development of changes already accomplished. Revolution is abrupt. Revolutions can occur in either direction, against the tide as well as with it. As action and reaction can be equal and opposite in physical motion, so in social change

revolution and counter-revolution can aim in opposite directions. In either case, whether revolution reverses the direction of change or precipitates a radical transformation toward which things are moving too slowly, revolution seems to involve *overthrowing* the established order rather than *developing* its latent tendencies.

It is in this sense that the revolutionist is a radical. He may also be a reactionary in the sense that the radical change he is willing to use force to achieve, is a return to some earlier condition rather than one which, in the judgment of his opponents, is in the line of progress or evolution. But whether reactionary or progressive the revolutionist is never conservative. If the established order does not submit readily to the radical change which a revolutionary person or party seeks, or if it resists, it must be forced to yield. The revolutionist can be reluctant to use force, but he can never forswear it entirely.

This seems to be the sense in which Marx and Engels conceive the program of the *Communist Manifesto* as a revolutionary program. Their conception of a revolutionary class or party is not, however, limited to the proletariat in their struggle against the bourgeoisie. They apply it to the bourgeoisie, not in the contemporary world when the established order of capitalism makes the bourgeoisie conservative or reactionary, but in the 18th century when the bourgeoisie overthrew the landed aristocracy.

"The bourgeoisie," they write, "historically has played a most revolutionary part. . . . The French revolution, for example, abolished feudal property in favor of bourgeois property." And again: "When Christian ideas succumbed in the 18th century to the rationalist ideas, feudal society fought its death-battle with the then revolutionary bourgeoisie." That the French Revolution represents the struggle not between the propertied and the propertyless classes, but between two propertied classes—the bourgeoisie and the aristocrats—seems evident to Marx in the fact that "during the very first storms of the revolution, the French Bourgeoisie dared to take away from the workers the right of association just acquired."

NO LESS THAN THE *Communist Manifesto*, the American Declaration of Independence is a rev-

olutionary document. Its signers are prepared to use force to overthrow the established order which, in their view, has worked grievous iniquities and injustices upon the colonies. But in the Marxist view the rebellion of the colonists, unlike the French Revolution, is political rather than economic, even if it has economic as well as political motivations. This distinction between economic and political revolution seems to be peculiarly modern.

It is not that the ancients—Thucydides, Plato, and Aristotle, for example—fail to recognize the "class war," which is paramount for Marx. They observe (as is indicated in the chapter on OLIGARCHY) the struggle between the rich and the poor for control of the state. They know that the opponents, in the frequent and violent revolutions which disturbed the Greek city-states, are the oligarchs and the democrats—the men of great property and the men of little or none.

The revolt of the Helots in Sparta is the exceptional case of a rebellion of slaves against their masters. For the most part, the struggle is between free men belonging to different economic classes. The oligarchical and democratic revolutions which these classes in society foment are political in the sense of seeking to change the constitution rather than the economic system itself, even though the constitutional changes may have economic as well as political effects. "In the opinion of some," Aristotle reports, "the regulation of property is the chief point of all, that being the question upon which all revolutions turn."

Aristotle is willing to admit that "the equalization of property" may "prevent the citizens from quarrelling," but he does not think that economic injustice is the only cause of revolution, or economic justice its absolute cure. "The avarice of mankind," he writes, "is insatiable; at one time two obols was pay enough; but now, when this sum has become customary, men always want more and more without end; for it is of the nature of desire not to be satisfied, and most men live only for the gratification of it. The beginning of reform," in his opinion, "is not so much to equalize property as to train the nobler sorts of natures not to desire more, and to prevent the lower from getting more; that is to say, they must be kept

down, but not ill-treated." Such a reform would hardly cure the evil of chattel slavery. That requires a revolution which effects the equalization of political status, not the equalization of property.

If a rebellion of slaves in the ancient world had succeeded in abolishing the institution of slavery, it would have been, in the modern view, an economic as well as a political revolution, for it would have radically altered the mode of production. It is in this sense that what Adam Smith describes as the change from an agrarian to a manufacturing economy, is strictly an economic revolution, though it is Marx, not Smith, who gives currency to the word "revolution" as used in this sense. It is exemplified in our common understanding of the phrase "the industrial revolution" which refers to the radical change in an economy based on manufactures, when mass production by machines in factories replaces the system of production by workers using their own tools in their own homes.

"In manufacture," writes Marx, "the revolution in the mode of production begins with labor-power; in modern industry it begins with the instruments of labor. Our first inquiry then is, how the instruments of labor are converted from tools into machines, or what is the difference between a machine and the implements of a handicraft?" But for Marx the meaning of economic revolution is not limited to radical changes in the physical conditions of production. Such changes necessarily involve equally radical changes in the social relationships of economic classes, and in their possession of political power. In the *Manifesto*, "the modern bourgeoisie" is said to be "itself the product of a long course of development, of a series of revolutions in the modes of production and exchange." The bourgeoisie, in turn, "cannot exist without constantly revolutionizing the instruments of production, and thereby the relations of production, and with them the whole relations of society."

According to Marx and Engels, "each step in the development of the bourgeoisie was accompanied by a corresponding political advance of that class. An oppressed class under the sway of the feudal nobility, an armed and self-governing association in the mediaeval com-

mune . . . afterwards in the period of manufacture proper, serving either the semi-feudal or the absolute monarchy as a counterpoise against the nobility . . . the bourgeoisie has at last, since the establishment of Modern Industry and of the world-market, conquered for itself in the modern representative State, exclusive political sway."

ON THE QUESTION whether economic revolutions, in their social and political aspects, require violence, the writers of the *Manifesto* seem to be unambiguous—at least so far as the communist program is concerned. Since "the Communist revolution is the most radical rupture with traditional property-relations," and "involves the most radical rupture with traditional ideas," it can hardly be expected to occur without open warfare, no less violent than the earlier struggle of the bourgeoisie against the aristocrats. Standing "face to face with the bourgeoisie today, the proletariat alone is a really revolutionary class," in whose development Marx and Engels see the transition from a "more or less veiled civil war, raging within existing society, up to the point where that war breaks out into open revolution, and where the violent overthrow of the bourgeoisie lays the foundation for the sway of the proletariat."

It is precisely on the use of force that the *Manifesto* distinguishes between communism and socialism, especially the "utopian" variety of the latter. The Socialists "reject all political, and especially all revolutionary action; they wish to attain their ends by peaceful means, and endeavor by small experiments, necessarily doomed to failure, and by the force of example, to pave the way for the new social Gospel. . . . They, therefore, endeavor, and that consistently, to deaden the class struggle and to reconcile the class antagonisms." Communist strategy, on the contrary, everywhere supports "every revolutionary movement against the existing social and political order of things. . . . The Communists disdain to conceal their views and aims. They openly declare that their ends can be attained only by the forcible overthrow of all existing social conditions."

Though fundamentally economic, the communist revolution cannot help having political effects. "Political power," according to Marx

and Engels, "is merely the organized power of one class for oppressing another." This applies to the proletariat's conquest of power. Yet they also seem to think that the dictatorship of the proletariat is only a temporary phase in the communist revolution. "If the proletariat during its contest with the bourgeoisie is compelled, by the force of circumstances, to organize itself as a class; if, by means of a revolution, it makes itself the ruling class, and, as such, sweeps away by force the old conditions of production, then it will, along with these conditions, have swept away the conditions for the existence of class antagonisms, and of classes generally, and will thereby have abolished its own supremacy as a class." In aiming at the economically classless society, with the consequent transformation of the state, the communist program seems to conceive its revolution as abolishing the possibility of or need for any further revolutions, peaceful or violent, economic or political.

IN ADDITION TO the issues raised by the economic theory and history which underlie revolutionary communism, there is the debatable question whether an economically classless society means the withering away of the state, or at least such changes in political institutions that revolution would cease to be possible or necessary. Even a hypothetical consideration of this question seems to call for attention to the various ways in which political revolutions take place. With the advent of the "classless society," no opportunity would remain, at least in theory, for the type of revolution in which one ruling class replaces another. But in such a society it is still conceivable that the equivalent of a palace revolution might substitute one ruling individual for another—by the old-fashioned methods of assassination or usurpation.

For Aristotle, however, all revolutions which produce a change from one form of government to another also involve the replacement of one ruling class by another. He distinguishes between such revolutions as affect the constitution, "when men seek to change from an existing form into some other, for example, from democracy into oligarchy, or from oligarchy into democracy," and those revolutions which do not affect the constitution, when men, "without disturbing the form of government, wheth-

er oligarchy or monarchy or any other, try to get the administration into their own hands." To these two types of revolution Aristotle adds a third, which "may be directed against only a portion of the constitution, e.g., the establishment or overthrow of a particular office; as at Sparta, it is said that Lysander attempted to overthrow the monarchy, and king Pausanias, the ephoralty."

Conceivably, any of these political changes might be accomplished without violence. In modern constitutional states, the basic principle of constitutions can be changed from oligarchy to democracy by amendments or legal reforms which extend the franchise. The structure of the government, as to its offices or their organization, can be changed by some form of peaceful plebiscite. As the Federalists point out, the polls provide a "natural cure for an ill-administration in a popular or representative constitution," namely, a change of men. But such changes of government in the ancient city-states, even when constitutional, appear to Aristotle to be revolutionary in the double sense of involving violence, or the threat of it, and of being radical transformations of the polity. What is true of constitutional changes in ancient republics is also true of monarchies and tyrannies, both ancient and modern.

When absolute power is concentrated in the hands of one man, his subjects are necessarily without juridical means for redressing their grievances by changing the occupant of the throne, much less for abolishing the monarchy entirely in favor of self-government. Machiavelli's advice to the prince on safeguarding his power against usurping rivals or rebellious subjects, seems to be written against the background of force and fraud as the normal methods of changing rulers or modes of rule. They are the very same methods which the prince in power must employ to maintain his position.

"There are two ways of contesting," Machiavelli writes, "the one by law, the other by force; the first method is proper to men, the second to beasts; but because the first is frequently not sufficient, it is necessary to have recourse to the second. Therefore it is necessary for a prince to understand how to avail himself of the beast and the man. . . . Being compelled knowingly to adopt the beast, [a prince] ought

to choose the fox and the lion; because the lion cannot defend himself against snares and the fox cannot defend himself against wolves." It follows, according to Machiavelli, that the prince seldom can be, though he should always try to *appear* to be, "merciful, faithful, humane, religious, upright. . . . A prince, especially a new one, cannot observe all those things for which men are esteemed, being often forced, in order to maintain the state, to act contrary to fidelity, friendship, humanity, and religion."

The stories of oriental despotism told by Herodotus, the account of the Caesars given by Tacitus and Gibbon, the chronicle of the English monarchy in the historical plays of Shakespeare, all seem to indicate that crowns seldom change heads without bloodshed. Machiavelli's rules for the prince do not greatly enlarge upon Aristotle's description of the arts by which the tyrant preserves his power." Even when Aristotle proposes, as an alternative method, that the tyrant can try to be benevolent, he adds the Machiavellian suggestion that the tyrant should at least "appear to act" like a good king.

The tyrant, Aristotle writes, "should lop off those who are too high. He must put to death men of spirit. . . . He must be on his guard against anything which is likely to inspire either courage or confidence among his subjects. He must prohibit literary assemblies or other meetings for discussion, and he must take every means to prevent people from knowing one another." After enumerating many similar practices which he calls "Persian and barbaric arts," Aristotle concludes that "there is no wickedness too great for the tyrant" if he is to maintain himself in power.

These matters are more fully discussed in the chapter on TYRANNY. In our present consideration of the types of revolution, we must note one other political change which usually involves the widespread turbulence of civil war. That is the rebellion of subject peoples against their imperial masters. Unlike civil uprisings, which seek to overthrow governments or effect a change in the ruling classes or persons, these wars of rebellion seek to liberate one people from another or to establish the independence of colonies at the expense of empire.

Still another type of insurrection aims at the dissolution of the state itself. What Rousseau

deals with in theory as the degeneration of the state into anarchy by the repudiation of the social contract, calls to mind no historic examples; but the few historic instances of "wars of secession" certainly illustrate the point. They aim to dissolve a federal state by severing ties of union which have something like a contractual character.

The distinction between these types of civil war may be clear in theory, yet difficult to apply to historic cases. Which sort of insurrection—a rebellion of colonies or a secession of states—does the Declaration of Independence announce? A theory current among American political writers in 1775 suggests that the thirteen colonies claimed the status of self-governing dominions in a confederacy united under the British crown. On this theory, does the principle stated in the Declaration—that it is sometimes "necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth the separate and equal station to which the laws of nature and of nature's God entitle them"—cover the secession of the Southern states from the American union, as well as the revolt of the American states from Great Britain, or the British Commonwealth of nations? Questions of fact are involved, of course, in any comparison of the Revolutionary War of 1776 and the war between the states in 1861; but the question of principle turns on the whole issue of whether revolution is a matter of might or right.

THE RIGHT OF REVOLUTION does not seem to be a central consideration in ancient political theory. The ancient discussion of revolutions appears to be more concerned with their causes, their methods, and their prevention. This does not mean that the ancients treat revolutions entirely as contests for power. On the contrary, Aristotle declares that "the universal and chief cause of the revolutionary impulse" is "the desire of equality, when men think that they are equal to others who have more than themselves; or, again, the desire of inequality and superiority, when conceiving themselves to be superior they think that they have not more but the same or less than their inferiors—pretensions which may or may not be just."

Nevertheless, Aristotle's elaborate treatise on revolution in the fifth book of his *Politics* deals alike with revolutions that spring from real and from fancied injustices. The object of his inquiry seems to be "what modes of destruction apply to particular states, and out of what and into what they mostly change; also what are the modes of preservation in states generally, or in a particular state, and by what means each state may be best preserved"—not how revolution can be justified or why rebellion is the crime of treason or the folly of anarchy. Such questions seem to come to the foreground in modern political theory, though they also have a certain prominence in mediaeval teaching.

Aquinas, for example, holds that sedition is "a special kind of sin" because it is "opposed to a special kind of good, namely, the unity and peace of a people." He qualifies this, however, in the case of an uprising against tyranny, even if it involves civil strife. Since in his view "a tyrannical government is not just, because it is directed, not to the common good but to the private good of the ruler . . . there is no sedition in disturbing a government of this kind, unless indeed the tyrant's rule be disturbed so inordinately that his subjects suffer greater harm from the consequent disturbance than from the tyrant's government. Indeed," Aquinas writes, "it is the tyrant rather who is guilty of sedition, since he encourages discord and sedition among his subjects, that he may lord over them more securely."

Holding that "the end of government is the good of mankind," Locke asks, in a similar vein, which is better: "that the people should be always exposed to the boundless will of tyranny, or that the rulers should be sometimes liable to be opposed when they grow exorbitant in the use of their power, and employ it for the destruction and not the preservation of the property of their people?" Since "force is to be opposed to nothing but unjust and unlawful force," Locke argues that a king may be resisted when he exceeds his authority or prerogative and uses his power unlawfully. Since such a king "has dethroned himself, and put himself in a state of war with his people, what shall hinder them from prosecuting him who is no king, as they would any other man who has put himself into a state of war with them?"

The right to resist a tyrant, or a king turned despot, may lead to regicide, but this seems no different to Locke from the punishment of any other criminal. "He who may resist must be allowed to strike"; and furthermore, Locke continues, "he has a right, when he prevails, to punish the offender, both for the breach of the peace, and all the evils that followed upon it." Rousseau is even less hesitant to condone tyrannicide. "The contract of government is so completely dissolved by despotism," writes Rousseau, "that the despot is master only so long as he remains the strongest; as soon as he can be expelled, he has no right to complain of violence. The popular insurrection that ends in the death or deposition of a Sultan is as lawful an act as those by which he disposed, the day before, of the life and fortunes of his subjects. As he was maintained by force alone, it is force alone that overthrows him."

Those who say that "it may occasion civil wars or intestine broils, to tell the people they are absolved from obedience when illegal attempts are made upon their liberties or properties . . . may as well say upon the same ground," in Locke's opinion, "that honest men may not oppose robbers and pirates because this may occasion disorder or bloodshed." Nor does Locke think that the right to resist injustice means that governments will be overthrown "upon every little mismanagement in public affairs. Great mistakes in the ruling part," he writes, "many wrong and inconvenient laws, and all the slips of human frailty will be borne by the people without mutiny or murmur. But if a long train of abuses, prevarications, and artifices, all tending the same way, make the design visible to the people . . . it is not to be wondered that they should then rouse themselves and endeavor to put the rule into such hands which may secure to them the ends for which government was at first erected."

Hence, to those who say that his revolutionary principle "lays a perpetual foundation for disorder," Locke replies that it will never operate until "the inconvenience is so great that the majority feel it, and are weary of it, and find it necessary to have it amended." Rebellions will occur only when the majority feel that "their laws, and with them their estates, liberties, and lives are in danger, and perhaps their religion

too," and so will exercise their natural right to resist, with force if necessary, the illegal force used against them. But strictly, it is not the people who rebel; rather it is they who put down the sedition of the tyrant.

What Locke states as a right of resistance, the Declaration of Independence seems to put more positively as a right of rebellion, apparently deducing it from other natural rights—of life, liberty, and the pursuit of happiness. It is to secure these rights that "governments are instituted among men," so that "whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it and to institute a new government." The Declaration admits that "governments long established should not be changed for light and transient causes"; but when a people suffer "a long train of abuses and usurpations . . . it is their right, it is their duty, to throw off such government, and to provide new guards for their security."

AGAINST SUCH REVOLUTIONARY sentiments or principles Hobbes, Kant, and Hegel seem to take a stand, though in each case they place some qualification on their denial of a right of resistance or rebellion. Hobbes, for example, denies the right of men to change their form of government, or of subjects to resist their Sovereign, *except for the sake of self-preservation*. When men covenant to form a commonwealth, they are bound, Hobbes says, to uphold the actions and judgments of the Sovereign they have created; they "cannot lawfully make a new covenant amongst themselves, to be obedient to any other . . . without his permission. . . . They that are subjects to a monarch, cannot without his leave cast off monarchy, and return to the confusion of a disunited multitude."

Furthermore, "because every subject is by this institution, author of all the actions and judgments of the Sovereign instituted, it follows," according to Hobbes, "that whatsoever he doeth, it can be no injury to any of his subjects; nor ought he to be by any of them accused of injustice." Yet "every subject has liberty in all those things, the right whereof cannot by covenant be transferred," such as the right of a man to defend his own body, "to resist those that assault him," or to have access to

"food, air, medicine, or any other thing without which he cannot live."

Kant disallows rebellion as a matter of right, unless resistance is required to fulfill a moral duty outside the sphere of public right. "'Obey the authority which has power over you' (in everything which is not opposed to morality) is a Categorical Imperative." Hence, though a juridical constitution "may be vitiated by great defects and coarse errors, it is nevertheless absolutely unallowable and punishable to resist it."

Since, in his view, public right is founded on the institution of "a *sovereign* will, uniting all particular wills by one law," Kant argues that "to allow a right of resistance to this sovereignty, and to limit its power, is a contradiction." It should be remembered also that for Kant the only legitimate form of government is a republic, resting on the foundation of popular sovereignty. Kant is not considering resistance to tyrannical or despotic power which lacks all juridical authority.

A similar qualification appears in Hegel's distinction between the rebellion of a conquered people and revolution in a well-organized state. Only the latter action is a crime, for only the latter situation corresponds to the Idea of the state—fully realized, for Hegel, only in a constitutional monarchy, never in a despotism or tyranny. "A rebellion in a province conquered by war," he says, "is a different thing from a rising in a well-organized state. It is not against their prince that the conquered are in rebellion, and they are committing no crime against the state, because their connexion with their master is not a connexion within the Idea, or one within the inner necessity of the constitution. In such a case, there is only a contract, no political tie."

With such qualifications on their position, those who disfavor revolution or deny its basis in right may not be completely opposed to those who apparently think rebellions can be justified. There may be qualifications on the other side too. Aquinas, for example, justifies sedition, not against any government or ruler, but only against tyranny. The signers of the Declaration of Independence speak of a right to alter or abolish "any form of government," but the writers of the Federalist papers do not seem equally willing to acknowledge a right to overthrow the Constitution of the United States.

OUTLINE OF TOPICS

PAGE

1. The nature of revolution	635
1a. The issue concerning violent and peaceful means for accomplishing social, political, or economic change	
1b. The definition of treason or sedition: the revolutionist as a treasonable conspirator	636
1c. Revolution and counter-revolution: civil strife distinguished from war between states	
2. The nature of political revolutions	
2a. Change in the form of government or constitution	
2b. Change in the persons holding power: deposition, assassination, usurpation	637
2c. Change in the extent of the state or empire: dissolution, secession, liberation, federation	638
3. The process of political revolution	
3a. The aims of political revolution: the seizure of power; the attainment of liberty, justice, equality	
3b. Ways of retaining power and combatting revolution	639
3c. The causes and effects of revolution under different forms of government	
(1) Revolution in monarchies	"
(2) Revolutions in republics: aristocracies, oligarchies, and democracies	640
(3) Rebellion against tyranny and despotism	
4. The nature of economic revolutions	641
4a. Change in the condition of the oppressed or exploited: the emancipation of slaves, serfs, proletariat	
4b. Change in the economic order: modification or overthrow of a system of production and distribution	
5. The strategy of economic revolution	
5a. Revolution as an expression of the class struggle: rich and poor, nobles and commons, owners and workers	642
5b. The organization of a revolutionary class: the bourgeoisie and the proletariat as revolutionary classes in relation to different economic systems	
5c. The classless society as the goal of economic revolution: the transformation of the state	
6. The justice of revolution	
6a. The right of rebellion: the circumstances justifying civil disobedience or violent insurrection	
6b. The right to abrogate the social contract or to secede from a federation	643
7. Empire and revolution: the justification of colonial rebellion and the defense of imperialism	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45 --(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 8I: RHETORIC

INTRODUCTION

RHETORIC is traditionally regarded as one of the liberal arts. When the liberal arts are counted as seven, and divided into the three and the four—the *trivium* and the *quadrivium*—rhetoric is grouped with grammar and logic, not with the mathematical arts of arithmetic and geometry, astronomy and music. The implication of this grouping seems to be that rhetoric, like grammar, has something to do with language or discourse; and that, like logic, it is concerned with thought, with reasoning or argument. But if grammar is the art of writing or speaking correctly, and if logic is the art of thinking correctly, it may be wondered what rhetoric can add to these other arts, either on the side of language or of thought.

Logic by itself does not suffice to ensure that words are properly used to express thought; nor does grammar guarantee that discourse which is flawless in syntax also complies with the demands of rationality. Hence neither grammar nor logic seems to challenge the function of the other, as together they challenge the function of rhetoric.

Upon the way this challenge is met depends not only the definition of rhetoric, but also the value put upon it. In the tradition of the great books, rhetoric is both praised as a useful discipline which liberally educated men should possess, and condemned as a dishonest craft to which decent men would not stoop. Like the words "sophistical" and "dialectical," the epithet "rhetorical" carries, traditionally as well as currently, a derogatory implication. The three words sometimes even tend to merge in meaning, expressing the same reproach against trickery. Yet of the three, "sophistical" alone implies an unqualified rebuke.

We do not speak of good and bad sophistry. But dialectic has its defenders as well as its detractors; and even those who, like Plato, charge

rhetoric with being an art of enchantment or a form of flattery also distinguish between a true and a false rhetoric, the one associated with dialectic as a wholly admirable pursuit, the other classed with sophistry as a vocation divorced from virtue. According to Bacon, the aim of rhetoric is to support reason, "not to oppress it." Rhetoric may be misused, but logic also has its abuses. "Rhetoric can be no more charged," in Bacon's opinion, "with the coloring of the worse part, than logic with sophistry, or morality with vice."

THE PURPOSE AND scope of rhetoric are capable of broad and narrow definitions. The broader view, which we shall consider subsequently, tends to merge rhetoric with poetics as together the art of eloquence in any sort of discourse. The narrower view tends to restrict rhetoric to the art of persuasion in the sphere of practical affairs. Rhetorical skill consists in getting others to embrace certain beliefs, to form the opinions or make the judgments which the speaker or writer wishes them to adopt. Usually action, not persuasion, is the ultimate goal. The rules of rhetoric are supposed to give one power not merely to move the minds of men to certain conclusions but, through persuasion of their minds, to move men to act or not act in a certain way.

The sphere of rhetoric, so conceived, is limited to moral and political problems. The things about which men deliberate before acting, the things on which they pass moral judgments or make political decisions, constitute the subject matter of oratory, or what Hobbes calls "exhortation and dehortation," that is, "counsel accompanied with signs in him that giveth it, of vehement desire to have it followed."

In the narrower conception, rhetoric seems to be confined to *oratory*. It is with oratory and

orators that Socrates seems to be concerned when he discusses rhetoric with Phaedrus or with Gorgias. Gorgias, who was a teacher of rhetoric, praises the power of the orator to persuade "the judges in the courts, or the senators in the council, or the citizens in the assembly, or at any other public meeting." In view of this Socrates asks him whether he will accept the definition of rhetoric as "the artificer of persuasion." When Gorgias admits that "persuasion is the chief end of rhetoric," Socrates goes on to ask whether rhetoric is "the only art which brings persuasion, or do other arts have the same effect? Does he who teaches anything persuade men of that which he teaches or not?" If so, "then arithmetic as well as rhetoric is an artificer of persuasion."

Gorgias reminds Socrates of his initial point about the orator, that "rhetoric is the art of persuasion in courts of law and other assemblies . . . about the just and unjust." But Socrates is still not satisfied that rhetoric has been sharply defined. He introduces the distinction between knowledge and belief or opinion, and gets Gorgias to agree that, whereas there cannot be false knowledge as well as true, beliefs and opinions may be either true or false. Persuasion can, therefore, be of two sorts—"one which is the source of belief without knowledge, as the other is of knowledge."

Gorgias is willing to limit rhetoric to that form of persuasion "which only gives belief," to which Socrates adds the emphatic negative that "the rhetorician does not instruct the courts of law or other assemblies about things just and unjust, but creates beliefs about them." If an assembly wishes to learn about matters connected with medicine or shipbuilding, it consults the physician or shipwright, not the orator. But, says Gorgias, "when a decision has to be given in such matters, the rhetoricians are the advisers; they are the men who win their point." He confirms this by reminding Socrates that the speeches of Themistocles and Pericles, not the suggestions of the builders, determined the Athenian assembly in the construction of the harbor, the docks and walls.

By way of further illustration, Gorgias tells of occasions when he has succeeded in getting patients to do what they would not do on the advice of their physicians. "I have persuaded

the patient," he says, "to do for me what he would not do for the physician, just by the use of rhetoric." Similarly, in a contest for public office between a rhetorician and a man of any other profession, "the rhetorician more than any other would have the power of getting himself chosen, for he can speak more persuasively to the multitude than any of them, and on any subject. Such is the nature and power of the art of rhetoric!"

In comparing it with dialectic, Aristotle seems to have a different conception of the function of rhetoric. "Neither rhetoric nor dialectic," he says, "is the scientific study of any one separate subject; both are faculties for providing arguments." Both also are concerned with arguments which fall short of scientific demonstration, that is, with matters of opinion concerning which something probable can be said on either side of the issue.

Though for Aristotle rhetoric is the counterpart of dialectic, in that both deal with arguments on any subject, his differentiation between the two disciplines seems to indicate that rhetoric is limited to the consideration of oratory in the familiar sense of public speaking. The rhetorician is concerned with persuading an audience, not, as the dialectician is, with carrying on a dispute in which two individuals may be privately engaged. The persuasion, furthermore, is directed to obtaining a certain response from that audience—not merely agreement, but either action, or a decision to act, or approval which, charged with emotional force or enthusiasm, has practical significance.

The divisions of rhetoric, according to Aristotle, are determined by the kinds of oratory, as these, in turn, are determined by the types of audience to be addressed. "Of the three elements in speech-making—speaker, subject, and person addressed," Aristotle writes, "it is the last one, the hearer, that determines the speech's end and object. The hearer must be either a judge with a decision to make about things past or future, or an observer. A member of the assembly decides about future events, a juryman about past events; while those who merely decide on the orator's skill are observers.

"From this it follows that there are three divisions of oratory: (1) political, (2) forensic, and (3) the ceremonial oratory of display"—or,

as these three are sometimes named, deliberative, legal, and epideictic. "Political speaking urges us either to do or not do something. . . . Forensic speaking either attacks or defends somebody. . . . The ceremonial oratory of display either praises or censures somebody. These three kinds of rhetoric refer to three different kinds of time. The political orator is concerned with the future; he tries to persuade men about things to be done or not done hereafter. The party in a case at law is concerned with the past; one man accuses the other, and the other defends himself, with reference to things already done. The ceremonial orator is, properly speaking, concerned with the present, since all men praise or blame in view of the state of things existing at the time, though they often find it useful also to recall the past and to make guesses about the future.

"Rhetoric has three distinct ends in view, one for each of its three kinds. The political orator aims at establishing the expediency or the harmfulness of a proposed course of action. . . . Parties in a lawsuit aim at establishing the justice or injustice of some action. . . . Those who praise or attack a man aim at proving him worthy of honor or the reverse."

THIS CONCEPTION OF rhetoric as concerned with oratory or public speaking gives one answer to the question of what rhetoric adds to grammar and logic as arts of discourse. In oratory more is involved than the communication of ideas, the marshalling of arguments, the making of proofs. Discourse, whether written or spoken, has an effect upon the emotions as well as upon the mind, and disposes a man to act as well as the mind to assent.

"The communicating of ideas by words," Berkeley observes, "is not the chief and only end of language, as is commonly supposed. There are other ends, as the raising of some passion, the exciting to or deterring from an action, the putting the mind in some particular disposition—to which the former is in many cases barely subservient, and sometimes entirely omitted. . . . I entreat the reader to reflect with himself, and see if it doth not often happen, either in hearing or reading a discourse, that the passions of fear, love, hatred, admiration, disdain and the like, arise immediately in his mind

upon the perception of certain words, without any ideas coming between."

Engaged in the oratorical task of persuading the people of New York to ratify the federal constitution, the writers of the Federalist papers are aware that "a torrent of angry and malignant passions will be let loose" in the debate of that issue. They realize that arguing for the adoption of certain political principles or conclusions is not like teaching geometry, the objects of which are "entirely abstracted from those pursuits which stir up and put in motion the unruly passions of the human heart."

Hamilton admits at once, in the opening paper, that "the plan offered to our deliberations affects too many particular interests, innovates upon too many local institutions, not to involve in its discussion, a variety of objects foreign to its merits, and of views, passions, and prejudices little favorable to the discovery of truth." Nevertheless, he tries to persuade his audience to judge the issue on the merits of the argument alone.

The opponents of the Constitution, he says, "may be actuated by upright intentions." The opposition may "spring from sources, blameless at least, if not respectable—the honest errors of minds led astray by preconceived jealousies and fears. So numerous indeed and so powerful are the causes which serve to give a false bias to the judgment, that we, upon many occasions, see wise and good men on the wrong as well as on the right side of questions of the first magnitude to society."

To recognize this, Hamilton tells his audience, is to be on guard "against all attempts, from whatever quarter, to influence your decision . . . by any impressions other than those which may result from the evidence of truth." He wishes them to consider him as relying upon nothing but the merits of his case. "I frankly acknowledge to you my convictions," he writes, "and I will freely lay before you the reasons on which they are founded. . . . My motives must remain in the depository of my own breast. My arguments will be open to all, and may be judged by all. They shall at least be offered in a spirit which will not disgrace the cause of truth."

We can detect here another element in the art of rhetoric. The orator seems to be concerned, not only with the strength of his argu-

ments and with the passions of the audience which he hopes to move by these arguments, but also with the impression he makes upon that audience as a person of good character and honest intentions, devoted to the truth and, above all, to the best interests of those whom he addresses.

The great speeches reported—or perhaps polished, if not invented—by Thucydides exemplify this effort on the part of the orator, as do also the orations written by Shakespeare for his characters, of which the speeches of Brutus and Antony in *Julius Caesar* are among the most notable as well as the most familiar. The point is also illustrated by the *Communist Manifesto*, which is denounced as “propaganda” by those who mistrust the writers, but to those who trust them is powerful and persuasive oratory.

Separating the use of witnesses and documents by the forensic orator from what he calls the strictly artistic means of persuasion—i.e., the means intrinsic to the art of rhetoric—Aristotle divides the latter into the three elements already noted. Persuasion, he says, depends “on the personal character of the speaker . . . on putting the audience into a certain frame of mind . . . [and] on the proof, or apparent proof, provided by the words of the speech itself. Persuasion is achieved by the speaker’s personal character when the speech is so spoken as to make us think him credible. . . . Secondly, persuasion may come through the hearers when the speech stirs their emotions. . . . Thirdly, persuasion is effected through the speech itself when we have proved a truth or an apparent truth by means of the persuasive arguments suitable to the case in question.”

These being the three technical means of effecting persuasion, Aristotle concludes that rhetorical skill must consist in the ability “(1) to reason logically, (2) to understand human character and goodness in their various forms, and (3) to understand the emotions . . . to know their causes and the way in which they are excited.” The art of rhetoric, therefore, involves more than training in grammar and logic. It requires the study of ethics and psychology—particularly knowledge of the types of human character and knowledge of the passions.

The same consideration of the conditions of

oratory seems to lead Socrates to tell Phaedrus that Thrasymachus or anyone else who teaches rhetoric ought “to give an exact description of the nature of the soul,” to explain “the mode in which it acts or is acted upon.” The rhetorician, he goes on, “having classified men and speeches, and their kinds and affections, and adapted them one to another,” will be able to “tell the reasons of his arrangement, and show why one soul is persuaded by a particular form of argument, and another not.”

THIS FACT ABOUT rhetoric—that it must adapt speech to persons as well as to subject matters—seems to occasion Socrates’ definition of oratory as “the art of enchanting the soul.” It is not, he tells Phaedrus, confined to courts and public assemblies. Whether this art is a good or evil thing depends on whether it requires the speaker to know—more than the nature of the person he is addressing—the truth about the matters spoken of. To engender probabilities in the minds of the many by the likeness of the truth, it is necessary, says Socrates, to know the truth. “He who knew the truth would always know best how to discover the resemblances of the truth.” Such a man might be able, not only to please and so to persuade his audience, but also, perhaps, he might “be able to say what is acceptable to God.”

The issue about rhetoric then—at least so far as that issue concerns its being an art consistent with virtue—seems to turn on the admixture of pleasure and truth. The question is whether, given a particular sort of audience to persuade, the orator does not have to choose between pleasing them and telling them the truth. Does the art of rhetoric extend to the persuasion of bad men as well as good? Is the skill of the orator to be measured by his success in persuading, without regard to the character of the audience he has persuaded and the means he has been forced to use? Does the goodness of the orator—and of his speech—depend upon his being morally virtuous as well as rhetorically skillful?

One view of rhetoric seems to identify persuasion with pleasure and to divorce it from truth. Pascal, for example, in his essay *On Geometrical Demonstration*, speaks of “two methods, the one of convincing, the other of pleasing.” In order

to persuade, he writes, "one must consider the person with whom one has to deal, whose spirit and heart one must know, the principles he accepts, the things he loves." In view of such considerations, Pascal holds that "the art of persuasion consists more in pleasing than in convincing, to such an extent is it true that men are controlled more by whim than by reason." He does not doubt that "there are rules which are as reliable with respect to pleasing as there are for demonstrating"; nor does he seem to condemn rhetoric for being such an art, unless he writes with irony when he says that "pleasing is incomparably more difficult, more subtle, more useful, and more admirable."

Rhetoric so conceived appears to Locke to be a "powerful instrument of error and deceit"; and to Plato to be no art at all, but a form of flattery. As cookery tries to please the palate without caring what is good for the health of the body, so rhetoric, according to Plato, aims to delight without caring what is good for the soul or the state. Cookery and rhetoric are shams or simulations of the genuine arts of medicine and politics, which aim at the good, not at pleasure. "This is the sort of thing," Socrates tells Callicles, "which I term flattery, whether concerned with the body or the soul, or whenever employed with a view to pleasure and without any consideration of good and evil."

Socrates then asks Callicles whether he knows rhetoricians who "aim at what is best . . . and seek to improve the citizens by their speeches," or whether all "are bent upon giving them pleasure, forgetting the public good in the thought of their own interest, playing with the people as with children, and trying to amuse them, but never considering whether they are better or worse for this."

When Callicles replies that he thinks "there are some who have a real care for the public in what they say," Socrates says that he is "contented with the admission that rhetoric is of two sorts: one, which is mere flattery and disgraceful declamation; the other, which is noble and aims at the training and improvement of the souls of the citizens, and strives to say what is best, whether welcome or unwelcome, to the audience." But, he asks Callicles, "have you ever known such a rhetoric; or if you have, and

can point out any rhetorician of this stamp, who is he?"

SOCRATES MAY NOT be asking a rhetorical question. He may be presenting the defenders of rhetoric with this critical dilemma: *either* the orator adheres to the truth and aims at the good, even if such highmindedness defeats his efforts at persuasion with an audience whom he thus displeases; *or* the orator takes persuasion as his end and subordinates everything else to the rhetorical means for succeeding with any sort of audience.

Bacon rises to the defense by rejecting the dilemma as ungentle. "The duty and office of rhetoric," he writes, "is to apply reason to the imagination for the better moving of the will." He admits that rhetoric is controlled by other considerations than the truth. Though "logic handleth reason exact and in truth," and though "the proofs and demonstrations of logic are toward all men indifferent and the same . . . the proofs and persuasions of rhetoric ought to differ according to the auditors."

Nevertheless, Bacon thinks "it was great injustice in Plato, though springing out of a just hatred for the rhetoricians of his time, to regard rhetoric as a voluptuary art, resembling it to cookery that did mar wholesome meats, and help unwholesome by a variety of sauces to please the taste. For we see that speech is much more conversant in adorning that which is good than in coloring that which is evil; for there is no man but speaketh more honestly than he can do or think; and it was excellently noted by Thucydides in Cleon, that because he used to hold on the bad side in causes of state, therefore he was ever inveighing against eloquence and good speech knowing that no man can speak fair of courses sordid and base."

Aristotle's defense of rhetoric seems to be implied in the remark that "its function is not simply to succeed in persuading, but rather to discover the means of coming as near such success as the circumstances of each case allow." Just as, for him, the sophist differs from the dialectician not in the skills of argument or dispute, but in moral purpose or respect for truth, so the name "rhetorician" may be applied to two sorts of men. Rhetoric may signify "either the speaker's knowledge of his art, or his moral

purpose." For want of separate names, both the honest and the sophistical orator are called and can claim to be "rhetoricians," and it is this which confuses the issue.

IN THE TRADITION of the great books, Aristotle's *Rhetoric* occupies a place comparable to that which, as noted in the chapter on POETRY, his *Poetics* unquestionably fills. It seems to be not merely the first but the standard treatise on oratory. It divides rhetoric into three parts—the first concerned with invention, the second with the disposition or order of a speech, the third with problems of expression. To the last of these belongs the analysis of the orator's use of language and his style in speaking; to the second, the analysis of the structure of an oration into such parts as proem, statement, argument, and epilogue; and to the first, under the head of invention, belongs the consideration of the means of persuasion.

As we have already noted, the artistic means of persuasion are, according to Aristotle, threefold—emotions, character, and argument. The orator must consider how to arouse and use the passions of his audience, as well as calculate how far to go in displaying his own emotions. He must consider the moral character of the audience to which he is appealing, and in this connection he must try to exhibit his own moral character in a favorable light. Finally, he must know the various types and sources of rhetorical argument—not only what sorts of argument are available for a particular purpose, but also how to employ each argument most persuasively. In this last respect, Aristotle distinguishes rhetorical proof from rhetorical induction—the use of what he calls the "enthymeme" as opposed to the use of examples—and he relates this distinction to the difference between dialectical proof and induction which he treats in the *Topics*.

Cicero and Quintilian may extend Aristotle's analysis in certain directions, but neither they nor modern writers like Campbell and Whately depart far from the framework Aristotle sets up for the discussion of oratory. Even those who reject Aristotle's authority in logic, natural philosophy, and metaphysics pay him the tribute of following (as does Hobbes) his treatment of oratory, or of approving (as does Bacon) his

contribution to rhetoric. In the case of this science, as with few others, Bacon finds no serious deficiencies in the accepted tradition. He calls rhetoric "a science excellent and excellently well labored," and places "the emulation of Aristotle" first among the causes why later writers "in their works of rhetorics exceed themselves."

Yet by another standard Aristotle's *Rhetoric* may be judged deficient. Because he confines his attention almost exclusively to oratory, Aristotle's discussion leaves rhetoric in a larger sense almost untouched. This limitation of rhetoric to the subject matter of oratory does not go unexplained. "Every other art," Aristotle writes, "can instruct or persuade about its own particular subject matter; for instance, medicine about what is healthy and unhealthy, geometry about the properties of magnitudes, arithmetic about numbers, and the same is true of the other arts and sciences. But rhetoric," he says, "we look upon as the power of observing the means of persuasion on almost any subject presented to us."

This last statement would seem to give rhetoric complete generality. Aristotle qualifies it, however. "People fail to notice," he says, "that the more correctly they handle their particular subject the further they are getting away from pure rhetoric." So far as knowing good arguments and knowing how to use them are concerned, the physicist and the mathematician need no help from rhetoric. The art of rhetoric is necessary only in dealing with such topics as do not fall within the subject matters or systems of the established arts and sciences. Such topics are precisely those with which the orator must deal. "The duty of rhetoric," Aristotle writes in summary, "is to deal with such matters as we deliberate upon without arts or systems to guide us, in the hearing of persons who cannot take in at a glance a complicated argument, or follow a long chain of reasoning." This is his answer to those who have given rhetoric "a far wider subject matter than strictly belongs to it."

But Aristotle's explanation of his limitation of rhetoric is itself limited to only one of its major parts, namely, the construction of arguments. As contrasted with the mathematician, the physician, and the philosopher, whose mastery of the subject matter of their arts or sci-

ences gives them a command of the relevant principles and methods of argument, only the orator needs the special art of rhetoric to provide him with the topics from which examples and enthymemes can be drawn and to give him skill in the use of such arguments. But it is not only the orator who must consider the character and emotions of his audience. It is not only the orator who must consider the best way in which to order the parts of an elaborate discourse. Above all, it is not only the orator who is faced with the problem of using language more or less effectively in the expression of thought, and especially in its communication to others. All these considerations and problems are common to the orator and the teacher. They are considerations and problems which must be faced not merely by the public speaker who tries to move an audience to action, but by anyone—poet, philosopher, or scientist—who tries to write whatever he has to say as effectively as possible.

Competence in a particular art or science may give a man competence with respect to arguments in the field of his particular subject matter, but it does not seem to give him competence with respect to these other considerations and problems, which he faces when he tries to communicate his knowledge or thought. Here, then, is the possibility of a broader conception of the art of rhetoric—an art concerned not merely with being persuasive in the sphere of action, but with eloquence or effectiveness in the expression of thought.

We find this view of rhetoric reflected in Chaucer's *Canterbury Tales*. In his Prologue, the Franklin asks his companions "to forgive his crude speech"; for, he explains, "I never learned rhetoric, to tell you the truth; whatever I say must be blunt and plain. I never slept on Mount Parnassus or studied Marcus Tullius Cicero." And the Squire apologizes for the inadequacy of his English to describe the beauty of Canace. "It woulde take an excellent rhetorician," he says, "who knew his colorful figures of speech, to describe her adequately." Though Aristotle's *Rhetoric* for the most part neglects this broader conception of rhetoric in order to expound the rules of oratory, the third book of his treatise, which deals with the use of language, indicates that problems of style are common to oratory

and poetry and to other types of discourse as well.

Kant seems to hold this broader conception of rhetoric when he says that "the arts of speech are *rhetoric* and *poetry*." In the tradition of western thought, the two arts tend to become identified when each is separated from any particular subject matter. As appears in the chapter on *POETRY*, poetry like rhetoric has a broader and a narrower meaning. In the narrower meaning, it is the art of the narrative, just as in its narrower meaning, rhetoric is the art of oratory. The other sense in which poetics as an art can be understood is, according to Bacon, with respect to words, not matter. "In this sense," he writes, "it is but a character of style, and belongeth to arts of speech."

In this sense the poetic art is hardly distinguishable from the rhetorical art. The problems involved in composing a good speech are not the same as those involved in writing a good poem (or what Bacon calls a "feigned history"). But when poetics and rhetoric are each separated from such problems to become the arts of writing or speaking well about anything, then, in becoming as general as discourse itself, they tend to become one and the same art—an art of style or expression, an art of preaching or teaching the truth about any matter on which one mind seeks to communicate with another.

IN THE TRADITION of the great books, no book does for the art of rhetoric in general what Aristotle's *Rhetoric* does for that art in the limited sphere of oratory. But Augustine's treatise *On Christian Doctrine* engages in a general rhetorical analysis that is in a way comparable to Aristotle's analysis of oratory. In this work Augustine brings his own professional training as an orator to bear on the problems of reading, interpreting, and expounding Sacred Scripture. The fact that he is dealing with Sacred Scripture and hence, in his view, with the teaching of the most fundamental truths, lifts him above the limited concerns of the orator; but the fact that he limits himself to Sacred Scripture also prevents him from formulating his rules of interpretation and exposition with the complete generality they would have to possess in order to be the rules of a general art of rhetoric.

At the opening of the fourth book of *Chris-*

tian Doctrine, Augustine declares that, having considered in the preceding books "the mode of ascertaining the proper meaning" of Scripture, he will now treat "the mode of making known the meaning when it is ascertained." He disclaims any intention "to lay down rules of rhetoric"; he wishes merely "to engage it on the side of truth." To this end he tries to show how Scripture itself, and such holy men as St. Cyprian and St. Ambrose in commenting on Scripture, have employed the art of rhetoric.

"It is the duty," Augustine writes, "of the interpreter and teacher of Holy Scripture . . . both to teach what is right and refute what is wrong; and in the performance of this task to conciliate the hostile, to rouse the careless, and to tell the ignorant both what is occurring at present and what is probable in the future. But once his hearers are friendly, attentive, and ready to learn, whether he has found them so, or has himself made them so, the remaining objects are to be carried out in whatever way the case requires." The first rule of a general rhetoric would thus seem to be one of creating a receptive frame of mind in the persons being addressed. This accomplished, the teacher must proceed with various alternatives in mind.

"If the hearers need teaching," Augustine writes, "the matter treated of must be made fully known by means of narrative. On the other hand, to clear up points that are doubtful requires reasoning and the exhibition of proofs. If, however, the hearers require to be roused rather than instructed, in order that they may be diligent to do what they already know, greater vigor of speech is needed. Here entreaties and reproaches, exhortations and upbraidings, and all the other means of rousing the emotions, are necessary."

In Scripture and its great commentators, Augustine finds "wisdom not aiming at eloquence, yet eloquence not shrinking from wisdom." He also finds examples of the three kinds of style which Cicero had distinguished—the eloquence of those "who can say little things in a subdued style, moderate things in a temperate style, and great things in a majestic style." These three styles Augustine connects with the three ends which Cicero had assigned to eloquence—teaching, giving pleasure, and moving. The subdued style, he says, should be used "in order to give

instruction," the temperate style "in order to give pleasure," and the majestic style "in order to sway the mind."

The great books of history, science, and philosophy provide additional materials for general rhetorical analysis. They offer us the light of examples at least, even if they do not, like Augustine's commentary on Scripture, give us the guidance of rules. Such historians as Herodotus, Thucydides, Tacitus, and Gibbon exhibit a diversity of styles in the writing of history. The diversity is not only on the grammatical level of the use of language, but also on the logical level of order and argument. Rhetorical principles control the way in which the language and the organization of the parts are suited to each other and to the historian's purpose—to the effect he wishes to produce upon his reader.

The way in which Euclid writes the *Elements* is a style of exposition, having rhetorical as well as logical features. In its rhetorical (if not its strictly logical) form it is applicable to other subject matters. This may be seen in Spinoza's adoption of it in his *Ethics* and in Newton's adaptation of it in his *Mathematical Principles of Natural Philosophy*. The dialogue form which Plato seems to have invented for writing philosophy appears to recommend itself rhetorically not only to other philosophers, but also to a scientist like Galileo in the composition of his *Two New Sciences*. If the doctrines of the *Summa Theologica* or of the *Critique of Pure Reason* were separated from the very special styles of these two works, they would probably not have the same effect upon the reader; and as they are written, they affect different readers differently, as differently as do the styles of Dante, Milton, Melville, Dostoevsky, Adam Smith, and Karl Marx.

Some methods of exposition may be more appropriate than others to certain subject matters. "There is a great difference in the delivery of mathematics," says Bacon, "and of politics." But in every subject matter or field of learning, there is the common problem of how to make language serve most effectively to enlighten or convince in the communication of thought. The problem arises in the writing of a single sentence as well as in the organization of a whole discourse.

THE CHOICE OF WORDS and the formation of new words, the invention and employment of figures of speech, by which abbreviation or amplification of discourse may be achieved and the imagination freshened—these are some of the considerations of style which Aristotle discusses (both in his *Rhetoric* and in his *Poetics*) and which Augustine illustrates in his analysis of Scripture. They suggest the rules of a general rhetoric, founded on principles as universal as Pascal's insight that "words differently arranged have a different meaning, and meanings differently arranged have a different effect."

This observation indicates a further answer to the question raised much earlier, namely, why the art of rhetoric is needed over and above the skills of grammar and logic. For oratory the question has been answered by reference to those rules of rhetoric which deal with the passions and with moral character. But for a more general rhetoric, concerned with all discourse, the answer must be in terms of rules of style of the sort Pascal's observation suggests.

If there were never more than one grammatically and logically correct way of saying anything, then grammatical and logical standards would suffice for the regulation of sound discourse. But if there are always several ways of stating something and if each of them satisfies the rules of grammar and logic, but differs in the impression it makes on the mind, then criteria other than those of grammar and logic will be needed to determine our choice of which to use.

Such criteria may take the passions and the imagination into account, but they may also look primarily to the manner in which the mind itself naturally works. The fact that there are several ways of presenting the same truth to the mind—and usually several ways in which the mind can interpret the same statement—defines the scope of a general rhetoric and the relation of its rules to those of grammar and logic.

Nevertheless, some of the great authors seem to doubt the worth of rhetoric in science or philosophy. Locke, for example, admits that "in discourses where we seek pleasure and delight rather than information and improvement, such ornaments"—as "figurative speeches and allu-

sion in language"—"can scarce pass for faults. But," he adds, "if we would speak of things as they are, we must allow that all the art of rhetoric, besides order and clearness, all the artificial and figurative application of words eloquence hath invented, are for nothing else but to insinuate wrong ideas, move the passions, and so, indeed, are perfect cheats . . . and where truth and knowledge are concerned, cannot but be thought a great fault, either of the language or person that makes use of them."

Descartes also declares that "those who have the strongest power of reasoning, and who most skilfully arrange their thoughts in order to render them clear and intelligible, have the best power of persuasion even if they can but speak the language of Lower Brittany and have never learned rhetoric." Yet he qualifies this severity somewhat by identifying dialectic with rhetoric and granting its "possible use . . . to serve to explain at times more easily to others the truths we have already ascertained."

Plato for the most part tends in the opposite direction, keeping dialectic and rhetoric poles apart. But if there were a true as opposed to a false rhetoric, a rhetoric concerned with knowledge and truth, not merely opinion and pleasure, he would be willing, it seems, to admit it to the company of dialectic, and regard it as an aid in the teaching, if not the discovery, of the truth. The pedagogical utility of rhetoric as well as dialectic appears in the summary which Socrates gives to Phaedrus, after they have finished examining the speeches about love.

"Until a man knows the truth of the several particulars of which he is writing or speaking," Socrates says, "and is able to define them as they are, and having defined them again to divide them until they can no longer be divided, and until in like manner he is able to discern the nature of the soul, and discover the different modes of discourse which are adapted to different natures, and to arrange and dispose them in such a way that the simple form of speech may be addressed to the simpler nature, and the complex and the composite to the more complex nature—until he has accomplished all this, he will be unable to handle arguments according to rules of art . . . either for the purpose of teaching or persuading."

OUTLINE OF TOPICS

	PAGE
1. The nature and scope of rhetoric	655
1a. The distinction of rhetoric from dialectic and sophistry: the rhetorician and the philosopher	
1b. The relation of rhetoric to grammar, logic, and psychology	656
1c. The relation of rhetoric to the arts of government: the orator and the statesman	
2. The function of rhetoric in expository, speculative, and poetic discourse	
2a. The devices of rhetoric: figures of speech; the extension and contraction of discourse	
2b. The canon of excellence in style	657
2c. Methods of exposition in history, science, philosophy, and theology	
2d. Principles of interpretation: the modes of meaning	658
3. The role of rhetoric as concerned with persuasion in the sphere of action: the analysis of oratory	
3a. The kinds of oratory: deliberative, forensic, epideictic	659
3b. The structure of an oration: the order of its parts	
3c. The use of language for persuasion: oratorical style	
4. The means of persuasion: the distinction between artistic and inartistic means	
4a. The orator's consideration of character and of the types of audience: the significance of his own character	
4b. The orator's treatment of emotion: his display of emotion; the arousal of his audience	660
4c. Rhetorical argument: the distinction between persuasion and demonstration	
(1) Rhetorical induction: the use of examples	
(2) Rhetorical proof: the use of enthymemes	661
(3) The topics or commonplaces which are the source of premises: the orator's knowledge of various subject matters	
5. The evaluation of oratory and the orator: the justification of rhetorical means by the end of success in persuasion	
5a. The purpose of oratory and the exigencies of truth	
5b. The orator's concern with justice, law, and the good: the moral virtue of the orator	
6. The education of the orator: the schools of rhetoric	662
7. The history of oratory: its importance under various social conditions and in different forms of government	
8. Examples of excellence in oratory	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 82: SAME AND OTHER

INTRODUCTION

THE problems of identity and diversity—of sameness and otherness, similarity and difference—occur at that level of philosophical thought which deals with being and with unity. Plotinus, for example, says that in addition to Being, Motion, and Rest, “we are obliged to posit the further two, Identity and Difference, so that we have in all five genera.”

In Aristotle's conception, terms like ‘being,’ ‘one,’ and ‘same’ have a greater universality than the terms he calls the highest genera, *e.g.*, ‘substance,’ ‘quantity,’ ‘quality,’ ‘relation,’ and so forth. These latter represent categories or classes under which certain things fall and others do not. Not everything is a substance or a quantity, but in Aristotle's opinion there is nothing of which it cannot be said that it is a being in some sense, that it has some kind of unity, that it is identical with itself, and that, compared with anything else in the whole universe, it is in certain respects the same, in others different.

The fundamental relation of quantities with one another, namely, equality, consists in their being the same. The fundamental relation of qualities consists in their being alike, or the same in spite of some difference in degree or intensity, *e.g.*, a brighter and a darker red of the same hue. The notion of relation itself seems to be as fundamental as that of sameness, since in comparisons one thing is said to be the same or different only in relation to something else; yet it also seems to be true that relations can be the same or similar, for the essence of proportion or analogy lies in one thing's being related to a second as a third is to a fourth. The sameness of two relationships is the object of the comparison.

Such considerations are sometimes called “metaphysical” with an invidious tone. But no one, not even those who would eliminate meta-

physical discussion as indulging in “vicious abstractions” or as verging on the meaningless, can easily avoid such notions as identity and diversity. It is not merely that ordinary speech, as well as scientific discourse, must use such words as “same” and “other” almost as frequently as the words “is” and “not” or “one” and “many.” Those who are critical of theorizing and who want to save discourse itself from becoming “too metaphysical” are still obliged to give some account of what it means for things to be the same or different and of how we know when they are.

Semantics currently has vogue as a critical instrument for safeguarding discourse from ambiguity and nonsense and perhaps also for spotting metaphysical legerdemain. But semantics itself cannot go far in its own analysis of words and meanings without having to explain how the *same* word can have *different* meanings or how the *same* meaning can be expressed by *different* words. It does not seem likely that an adequate explanation could be developed without some theory of sameness and otherness.

THE “SENSE OF SAMENESS,” says William James, “is the very keel and backbone of our thinking.” He is here speaking “of the sense of sameness from the point of view of the mind's structure alone, and not from the point of view of the universe. . . . Whether there be any *real* sameness in *things* or not, or whether the mind be true or false in its assumptions of it,” he goes on, the point remains that “the mind makes continual use of the *notion* of sameness, and if deprived of it, would have a different structure from what it has. . . . Without the psychological sense of identity, sameness might rain down upon us from the outer world forever and we be none the wiser. With the psychological sense, on the other hand, the outer world might

be an unbroken flux, and yet we should perceive a repeated experience."

James distinguishes three principles of identity. In addition to the *psychological* law according to which we feel a later experience to be the same as an earlier one, he refers to the *ontological* principle which "asserts that every real thing is what it is, that *a* is *a*, and *b*, *b*"; and the *logical* principle which declares that "what is once true of the subject of a judgment is always true of that subject." James seems to think that "the ontological law is a tautological truism," whereas the logical and the psychological principles have further implications not immediately obvious. Locke appears to take a contrary view. He finds the identity of all *ideas* self-evident, while to him the real identity of *things* is much more difficult to grasp.

The principle of identity and its companion principle of contradiction are, according to Locke, expressed in the propositions 'Whatever is, is' and 'It is impossible for the same thing to be and not to be'—"these two general propositions amounting to no more, in short, but this, that the same is the same, and the same is not different." But, Locke adds, "the mind, without the help of any proof or reflection on either of these general propositions, perceives so clearly, and knows so certainly, that 'the idea of white is the idea of white, and not the idea of blue,' and that 'the idea of white, when it is in the mind, is there and is not absent,' that the consideration of these axioms can add nothing to the evidence or certainty of its knowledge. . . . I appeal to everyone's own mind, whether this proposition 'A circle is a circle' be not as self-evident a proposition as that consisting of more general terms 'Whatsoever is, is.'"

But unlike the comparing of an idea, with itself, real identity, according to Locke, requires us to consider a thing "as existing at any determined time and place" and to "compare it with itself existing at another time. . . . When, therefore, we demand whether anything be the same or no? it refers always to something that existed at such a time in such a place, which, it was certain, at that instant, was the same with itself and no other; from whence it follows that one thing cannot have two beginnings of existence, nor two things one beginning,

it being impossible for two things of the same kind to be or exist in the same instant in the very same place, or one and the same thing, in different places. That, therefore, that had one beginning is the same thing; and that which had a different beginning in time and place from that, is not the same, but diverse." In short, across a lapse of time a thing remains identical, in Locke's view, or maintains its identity, if existence having made it "one particular thing under any denomination, the same existence continued preserves it the same individual under the same denomination."

THIS UNDERSTANDING OF real identity Locke applies without difficulty to an atom of matter which, being at a given instant "what it is and nothing else . . . is the same and so must continue as long as its existence is continued; for so long it will be the same, and no other. In like manner, if two or more atoms be joined together into the same mass, every one of those atoms will be the same by the foregoing rule; and whilst they exist united together, the mass consisting of the same atoms, must be the same mass or the same body, let the parts be ever so differently jumbled. But," Locke continues, "if one of these atoms be taken away, or one new one added, it is no longer the same mass or the same body."

The problem of identity in living organisms Locke does not find so easy to solve. "In the state of living creatures," he says, "their identity depends not on a mass of the same particles, but on something else. For in them the variation of great parcels of matter alters not the identity; an oak growing from a plant to a great tree, and then lopped, is still the same oak; and a colt grown up to a horse, sometimes fat, sometimes lean, is all the while the same horse, though in both these cases there may be a manifest change of the parts, so that truly they are not, either of them, the same masses of matter."

The problem of the real identity or continuity of living things through time and change is, as we shall see presently, only a special case of the larger problem of whether anything at all remains identical for more than an instant in the universal flux of things. But supposing that problem solved in favor of en-

during substances, or things which somehow remain continuously the same while changing in this or that respect, the point of Locke's observation about living things still holds, for their identity does not seem to lie in the continuity or permanence of the matter—the particles—of which they are composed.

The familiar riddle about the pipe—whether it is in any respect the same after it has its broken bowl replaced by a new one, and then has a new stem added to the new bowl—may be propounded for living organisms. But in their case, Locke argues, a principle of identity can be found. A plant, he says, “continues to be the same plant as long as it partakes of the same life, though that life be communicated to new particles of matter vitally united to the living plant, in a like continued organization conformable to that sort of plant.”

The principle, he thinks, applies to animals and men. “The case is not so much different in brutes but that anyone may hence see what makes an animal and continues it the same. Something we have like this in machines, and may serve to illustrate it. For example, what is a watch? It is plain it is nothing but a fit organization or construction of parts to a certain end, which, when a sufficient force is added to it, it is capable to attain. If we would suppose this machine one continued body, all whose organized parts were repaired, increased, or diminished by a constant addition or separation of insensible parts, with one common life, we should have something very much like the body of an animal. . . . This also shows wherein the identity of the same man consists; *viz.*, in nothing but a participation of the same continued life by constantly fleeing particles of matter, in succession, vitally united to the same organized body.”

IN THE CASE OF MAN, however, Locke thinks we must face the additional problem of personal identity. What makes a man the same person from moment to moment, sleeping and waking, remembering or not remembering his past? In what does the continuity of the self consist, on the identity of which, Locke insists, “is founded all the right and justice of reward and punishment”? His answer seems to be that, as a living organism is identical throughout one

and the same life, it is the continuity of the same consciousness which “makes a man be himself to himself” and establishes his personal identity.

“Whatever has the consciousness of present and past actions,” Locke writes, “is the same person to whom they both belong. . . . That with which the consciousness of this present thinking thing *can* join itself, makes the same person, and is one self with it, and with nothing else. . . . If the same Socrates, waking and sleeping, do not partake of the same consciousness, Socrates, waking and sleeping, is not the same person. And to punish Socrates waking for what sleeping Socrates thought, and waking Socrates was never conscious of, would be no more right than to punish one twin for what his brother twin did, whereof he knew nothing, because their outsides were so like that they could not be distinguished.”

William James also attributes the sense of personal identity to continuity of consciousness, but for him there still remains a problem of explaining that continuity. In the flow of consciousness from moment to moment, “continuity,” he thinks, “makes us unite what dissimilarity might otherwise separate; similarity makes us unite what discontinuity might hold apart. . . . The sense of our personal identity, then, is exactly like any one of our other perceptions of sameness among phenomena. It is a conclusion grounded either on the resemblance in a fundamental respect, or on the continuity before the mind, of the phenomena compared.”

In his opinion, “*resemblance among the parts of a continuum* of feelings (especially bodily feelings) experienced along with things widely different in all other regards, *thus constitutes the real and verifiable ‘personal identity’ which we feel*. There is no other identity than this in the ‘stream’ of subjective consciousness. . . . Its parts differ, but under all their differences they are knit in these two ways; and if either way of knitting disappears, the sense of unity departs. If a man wakes up some fine day unable to recall any of his past experiences, so that he has to learn his biography afresh . . . he *feels* and he *says* that he is a changed person. He disowns his former me, gives himself a new name, identifies his present life with nothing from out of

the older time. Such cases are not rare in mental pathology."

In the tradition of the great books, other solutions are offered to the problem of personal identity. Kant thinks, for example, that a "transcendental unity of apperception" is necessary to constitute "in all possible phenomena which may come together in our experience, a connection of all these representations according to laws. Unity of consciousness," he writes, "would be impossible if the mind, in the knowledge of the manifold, could not become conscious of the identity of function by which it unites the manifold synthetically in one knowledge. Therefore, the original and necessary consciousness of the identity of one's self is at the same time a consciousness of the equally necessary unity of the synthesis of all phenomena according to concepts."

Where Kant posits a transcendental ego to account for the experienced identity of the self, other philosophers who hold one or another theory of the soul as an imperishable substance or an unchanging principle seem to find no special subtleties in the problem of the identity of living organisms or persons. So far as such theories bear upon that problem, the consideration of them belongs to the chapter on SOUL. Here we are concerned with the notions of same and other as they apply to everything in the universe. Hence we must face all the problems of how two things can be the same, not merely the problem of self-sameness or the identity of a thing with itself.

THE WORD "IDENTICAL" is sometimes used as a synonym for "same," as when we say that two things are identical in a certain respect. But without the qualification expressed by "in a certain respect," it is seldom if ever said that two things are identical, for if they can be discriminated from one another in any respect at all, they are two, not one, and therefore not identical. This seems to be the sense of Leibnitz's principle of the identity of indiscernibles, concurred in by all who understand identity as the self-sameness of that which is one in number and existence. A plurality of things involves a numerical diversity—each of the many being an *other*. To this extent at least, the traditional discussion of same and other tends to merge

with matters discussed in the chapter on ONE AND MANY.

For both Plato and Aristotle, the relation between these two pairs—*one and many* and *same and other*—seems to be much closer. In the comparison of two things, Aristotle appears to treat sameness as a kind of oneness, referring to the various ways in which two things can be "one and the same." Of sameness, he says that "it is a unity of the being, either of more than one thing or of one thing when it is treated as more than one." And of the one he says that to it "belong . . . the same and the like and the equal, and to plurality belong the other and the unlike and the unequal."

The enumeration he gives of kinds of unity seems to be paralleled by his enumeration of kinds of similitude. As a thing may be one essentially or one by accident, so two things may be the same essentially or by accident. Aristotle's statement that "some things are one in number, others in species, others in genus, others by analogy," finds its counterpart in his statement that "different is applied to those which, though other, are the same in some respect, only not in number, but either in species or in genus or by analogy."

As indicated in the chapter on RELATION, a distinction is traditionally made between relationships which really exist among things apart from the mind, and logical relationships which occur in thought alone. This distinction seems to separate self-sameness or identity from all relations of similitude which obtain between two things. "The relation signified by the term *the same*," Aquinas says, "is a logical relation only if it is taken in regard to absolutely the same thing, because such a relation can exist only in a certain order observed by reason as regards the order of anything to itself. The case is otherwise, however, when things are called the same, not numerically, but generically or specifically."

Nevertheless, identity seems to underlie all other relations of sameness, for among things or ideas lacking identity no comparisons can be made. Those who deny identity on the ground that everything is in flux, nullify all further discussion of sameness. The theory of a universal flux, which Plato attributes to Heraclitus, permits nothing ever to remain stationary or the

same for an instant; and "the professed Heraclitean," Cratylus, went even further, according to Aristotle: he "criticized Heraclitus for saying that it is impossible to step twice into the same river; for *he* thought one could not do it even once."

In saying of men that "they are *nothing but a bundle or collection of different perceptions*, which succeed each other with an inconceivable rapidity, and are in a perpetual flux and movement," Hume does more than deny personal identity. He affirms an utter diversity—"as if there were no manner of relation" at all—between distinct perceptions, each of which is for him a distinct existence. The opposite point of view affirms things which have an enduring existence and which can, as Aristotle says of substances, undergo change in many respects "while remaining numerically one and the same."

TIME AND CHANGE raise the question of how any one thing can be the same from moment to moment. The question of how two things can be one and the same in any respect arises from the simple fact that, at the instant of comparison, they are two. If they were the same only for the comparing mind, then their sameness would be a logical and not a real relationship. For two things to be the same in reality seems to imply that, although two in number, they are one in some respect. To use Hegel's language, there is identity in diversity; or, in the language of Aquinas, a real community exists, according to which some one thing is common to two.

The problem of the sameness of two things can be stated in terms of the significance of what Hobbes, Berkeley, and Hume call common or general names. Denying that such words as "man" or "tree" or "stone" express abstract or general ideas, they seem to say that common names like these signify what is common to two or more individuals—whether things, perceptions, or ideas. Those who, like Aristotle, Aquinas, and Locke, take general or common names to signify abstract ideas, seem to say such ideas themselves signify that in reality two or more things have something in common. Still another view is that, apart from all individual things, real universals exist as the objects of the mind's conceptions.

If the latter alternative is chosen, then two individuals—two men, for example—may be thought alike only because both somehow resemble, as Plotinus suggests, the separate archetype Man. What is common to the two men lies in a third and separate reality, of which Plotinus says that it is "present in multiplicity," as if "in multi-impression . . . from one seal." But as Parmenides observes, in Plato's dialogue of that name, if a separate idea of Man is required to explain how two individuals are alike in being men, then still another idea is needed to account for the likeness between each individual man and the idea Man.

On the other hand, the view that the real sameness of two individuals, or the reality of the one kind to which both belong, resides in them—in their common possession of the same nature, quality, or other attribute—seems to lead to the difficulty already intimated, namely, the difficulty of understanding how distinct existences can have anything in common—how they can be two in number and yet also one in nature. If John and James are alike as men because they share a common humanity, then can it be said that each has *his own* human nature? If their natures and properties are as individual as their existences, how can two things be *really the same* in any respect? Must not kinds or universals—or whatever is supposed to be common to many and the source of their sameness—exist only in the general meaning of words, or in the mind's abstract concepts, or as separate archetypes? But, then, what truth is there in the familiar statement that two individual things are in some respect *really* alike or the same?

THESE QUESTIONS indicate that the traditional discussion of the same and the other tends to involve not merely the theory of the one and the many, but also, in certain issues at least, the problem of the individual and the universal. As the chapter on UNIVERSAL AND PARTICULAR shows, the several positions traditionally taken with regard to universals afford different answers to the problem of how any sameness between two or more things exists. The factor of similitude in knowledge (the nature of the likeness between image or idea and its object) and the function of similitude in love (the attrac-

tion, or repulsion, of like by like) also extend the consideration of sameness and diversity into the field of problems dealt with in other chapters. Here attention must be given to the meaning of sameness itself, as that is affected by the distinction between the same and the similar, by the enumeration of various kinds or degrees of likeness, and by the range of opposite meanings in the notions of diversity and difference.

Discussing discrimination and comparison, William James, for example, draws a sharp line between the simple and complex components of our experience. Simple impressions, he seems to think, are either absolutely alike or absolutely unlike. Here there can be no degrees of resemblance or similarity. "Two resembling things," he writes, "owe their resemblance to their absolute identity in respect to some attribute or attributes, combined with the absolute non-identity of the rest of their being. This, which may be true of compound things, breaks down when we come to simple impressions." The latter, apart from their numerical non-identity or otherness, are either the same in quality or diverse. But compound things may be more or less alike, varying in degree of similarity or difference according to the number of simple respects in which they are or are not the same.

"Similarity, in compounds," says James, "is partial identity," and he gives the following illustrations. "The moon is similar to a gas-jet, it is also similar to a foot-ball; but a gas-jet and a foot-ball are not similar to each other. . . . Moon and gas-jet are similar in respect of luminosity and nothing else; moon and foot-ball in respect of rotundity, and nothing else. Foot-ball and gas-jet are in no respect similar—that is, they possess no common point, no identical attribute."

Other writers seem to agree on this distinction between the same and the similar, the diverse and the different. The latter in both cases combine elements of sameness and diversity to give degrees of likeness. Aquinas, for example, says that "we seek for difference where we also find resemblance. For this reason, things which differ must in some way be composite, since they differ in some respect and in some respect they resemble each other. In this sense, although all things that differ are

diverse, yet all things that are diverse do not differ. . . . For simple things are diverse through themselves, and do not differ from one another by differences as their components. For instance, a man and an ass differ by the difference of rational and irrational, but we cannot say that these again differ by some further difference."

The specific difference between man and ass with respect to rationality, accompanied by their generic sameness with respect to animality, makes them similar. If they were utterly diverse, *i.e.*, the same in no respect, they would not be said to differ; just as if they were identical in all respects except number, they would not be called similar. "The other and the same," writes Aristotle, "are thus opposed. But difference is not the same as otherness. For the other and that which it is other than need not be other in some definite respect . . . but that which is different is different from some particular thing in some particular respect, so that there must be something identical by which they differ."

But within the area of this agreement on fundamental terms, there seems to be some disagreement about whether two things can be utterly diverse. Since they are two, they cannot be the same in *all* respects—certainly not in number—but can they be totally incomparable? James appears to say Yes in his remark about the football and the gas jet having "no common point, no identical attribute." Yet he also seems to hold that no two things are ever absolutely incomparable. They may not differ or be similar as the diverse species of the same genus, *e.g.*, man and ass; but regarding them as "'thinkables' or 'existents,'" he writes, "even the smoke of a cigarette and the worth of a dollar bill are comparable—still more so as 'perishables' or as 'enjoyables.'" The gas jet and the football would appear to be comparable also as 'existents' or 'usables'—or even, perhaps, as 'bodies.'

The question thus arises whether—all things being somehow comparable—they are all the same in genus, as, for example, all three-dimensional material things may be said to belong to the genus 'body' no matter how much else they differ as species or subordinate kinds within this genus. Kant answers this question by affirming a principle of ultimate homogeneous-

ness. According to this principle, "there are no different original and first *genera*, as it were isolated and separated from each other, but all diverse *genera* are divisions only of one supreme and general *genus*." Kant states a correlative principle of variety or specification, according to which "every *genus* requires *species*, and these again *sub-species*, and as none even of these *sub-species* is without a sphere . . . reason in its utmost extension requires that no species or sub-species should in itself be considered as the lowest."

Aristotle's theory of species and genera appears to be exactly opposite to Kant's on both points. For Aristotle, there is no single all-embracing genus, but rather a number of diverse yet supreme genera, such as substance, quantity, quality, etc. There is a finite, not an infinite variety of species. The lowest species is further divisible only into kinds which differ, as individuals of the same species do, in accidental, not essential respects, e.g., white man and red man differ in the same way as John and James do within the species 'man,' not as the species 'man' and 'ass' differ within the genus 'animal.' Furthermore, where Kant insists upon a third principle of continuity, according to which between any two species "there always remain possible intermediate species, differing from the first and the second by smaller degrees than those by which these differ from each other," Aristotle seems to find no intermediates possible between the contrary species of a single genus. The order of species is for him a discontinuous series like the order of the whole numbers, between proximate members of which no fractions are admitted.

Does Aristotle's position with respect to the *heterogeneity* of an animal and the color blue—the one in the genus 'substance,' the other in the genus 'quality'—mean that such things, *absolutely diverse in genus*, are absolutely incomparable? His answer seems to be twofold. In one place he says that things which are diverse in genus may still be the same by analogy: "things that are one by analogy are not all one in genus." In another, he gives us an example of analogical resemblance (between the soul and the hand): "As the hand is a tool of tools, so the mind is the form of forms and sense the form of sensible things."

If the example seems inappropriate on the ground that the soul and the hand are of the same genus, *i.e.*, both substances or parts of the same substance *man*, it may be necessary to introduce the distinction between natural and logical genera. According to this distinction, a material and a spiritual substance can both be called "substances" as a matter of logical classification, but they are not in the same genus by their own natures. In this sense, Aquinas assigns a geometrical solid and a physical body to the same logical genus 'body' but regards them as of heterogeneous natures; and Descartes, calling an extended and a thinking substance both "substances," insists upon the utter diversity of their natures.

An easier example, however, may not be too difficult to find. A man and a number belong to different genera, according to Aristotle—one a substance, the other a quantity. But the man can be related to his sons as the number *one* is related to any other whole number. The relation which is the same in both cases is that of priority, according to which the man and unity are the principles or generators respectively of his sons and other numbers. Here, then, we see two heterogeneous things—a substance and a quantity—which are, nevertheless, the same by analogy, *each standing to another in the same relationship*; both, therefore, can be called "principle" or "generator" analogically.

Aristotle's other indication that a special mode of similitude obtains between heterogeneous things, occurs in all those passages in which he says that terms like 'being' can be predicated of things in every category or genus. Just as James seems to think that any two things may be comparable as 'thinkables' or 'existents,' so Aristotle seems to hold that all things, though otherwise heterogeneous, are at least alike in *being*, *i.e.*, in having some mode of existence. Yet the term 'being' cannot be equated with Kant's single supreme genus. Though Aristotle agrees with Kant that every genus must be capable of division into species, he does not think that 'being' can be so divided by specific differences.

TWO POINTS MUST be observed concerning Aristotle's theory of the predication of a term like 'being' of everything in the universe.

First, he repeatedly asserts that 'being' is not said *in the same sense* of substances, quantities, qualities, and so forth. Hence when such heterogeneous things are all called 'beings,' the implication cannot be that, as beings, they are all the *same*. The point seems to be that they are somehow *at once both the same and diverse*. As, to use an example from Aristotle's *Physics*, a tone and a taste can both be sharp, though the sharpness of a tone is as diverse from the sharpness of a taste as tone and taste are qualitatively diverse from each other; so a man and a number can both have being, though their modes of being are as diverse as substance is from quantity. If the word "similarity" were to be used to signify not the combination of separable elements of sameness and diversity, but rather the inseparable fusion of the two to constitute a *diversified sameness*, then heterogeneous things should be called *similar*, not the same, in being.

Second, Aristotle does not identify such similarity of heterogeneous things with the sameness by analogy which heterogeneous things can have. 'Being' is not a relative term and therefore it cannot be predicated analogically, as 'principle' or 'generator' can be. Terms which are predicated analogically, as 'principle' can be predicated of a father and the number one, may signify *similarity* (in the sense of *diversified sameness*) rather than simple sameness in a single respect. The relation of generation which creates the analogical similitude between a father and the number one seems to be the same relation in the two cases (between a father and his sons, and between one and other numbers); it is not, however, simply the same, for that relation is diversified according as the things related—substances in the one case, quantities in the other—are absolutely diverse in genus. But in Aristotle's analysis it does not follow that because some analogical predicates signify *diversified* rather than *simple* sameness, all do; or that because some instances of *diversified sameness* happen to be analogical (*i.e.*, sameness in a relation), all are.

The interest in Aristotle's separation of these two points lies in the fact that Aquinas combines them in a theory which states that, when being and other terms (which are not genera and yet are above all genera) are predicated of

heterogeneous things, they must be predicated analogically of them. The existence which is found in all things, he says, "is common to all only according to some sort of analogy," not "according to the same specific or generic formality." This is most easily seen in the "likeness of creatures to God," which is "solely according to analogy, inasmuch as God is essential being, whereas other things are beings by participation."

Aristotle's statement that "things which are one by analogy are not all one in genus," seems to be converted by Aquinas into the proposition that *things which are not one in genus, and yet are alike in some way, are all one by analogy*. For Aristotle, sameness by analogy may be either simple sameness or diversified sameness (*i.e.*, similarity); and diversified sameness may or may not be analogical, that is, it may be the kind of similarity which two heterogeneous things have in respect to being or in respect to some relation in which they stand to other things. For Aquinas, on the other hand, whenever heterogeneous things are the same in any single respect, their diversified sameness is *always analogical*; and whenever the similitude between two things is truly analogical, then it is *always similarity*, that is, a diversified, not a simple sameness. Likeness in being, according to Aquinas, affords us the prime example of a similitude which is at once an analogical and a diversified sameness.

Aquinas applies his theory of the analogy of being to the great traditional issue, which puts all theories of similitude to the test—the question of the resemblance between God and creatures, or between infinite and finite being. Against the answer first given by Maimonides, and later expressed by Spinoza when, of all comparisons between God and man, he says that "His essence . . . could resemble ours in nothing except in name"; and against those, on the other hand, who think that whatever names apply to both God and creatures (such as "being" or "good" or "one"), apply simply in the *same* sense, Aquinas seems to take the middle ground. The names which are properly applicable to both God and creatures, according to him, are said of them, not equivocally and not univocally, but analogically.

This threefold distinction of univocal, equiv-

ocal, and analogical names, especially as it concerns the names of God, is discussed in the chapter on SIGN AND SYMBOL. The theological problem of the similitude between God and creatures confronts us with three basic alternatives in man's speculation about the sameness and diversity which exists among all things. We can say, (1) that infinite and finite being are

utterly diverse, and have no similarity *even* in being. We can say, (2) that they are homogeneous—that, with respect to being, for example, they have the kind of sameness which things have when they belong to the same genus. Or we can say, (3) that they are only similar in the sense of a diversified sameness, whether such similarity is or is not always analogical in character.

OUTLINE OF TOPICS

	PAGE
1. The principle of identity: the relation of a thing to itself	674
1a. Oneness in number or being: numerical diversity or otherness	
1b. The identity of the changing yet enduring individual: personal identity, the continuity of self; the denial of identity in the realm of change	675
2. The sameness of things numerically diverse	
2a. The being of sameness or similitude: the reality of kinds or universals	
2b. The relation between sameness and unity: sameness as a participation in the one	
2c. The distinction between sameness and similarity and their opposites, diversity and difference: the composition of sameness and diversity; degrees of likeness and difference	
2d. The distinction of things in terms of their diversities and differences: real and logical distinctions	676
2e. The limits of otherness: the impossibility of utter diversity	
3. The modes of sameness and otherness or diversity	
3a. Essential sameness or difference and accidental sameness or difference	
(1) Specific and generic sameness: natural and logical genera	
(2) The otherness of species in a genus: the diversity of contraries	677
(3) Generic otherness or heterogeneity	
3b. Relational sameness: sameness by analogy or proportional similitude	
3c. Sameness in quality, or likeness: variations in degree of the same quality	678
3d. Sameness in quantity, or equality: kinds of equality	
4. Sameness and diversity in the order of knowledge	
4a. Likeness or sameness between knower and known: knowledge as involving imitation, intentionality, or representation	
4b. The role of differentiation in definition: the diversity of differences	679
4c. Sameness and diversity in the meaning of words or the significance of terms: the univocal and the equivocal	
5. The principle of likeness in love and friendship	
6. Similitude between God and creatures: the degree and character of the similitude; traces or images of God in creatures	680

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example, in 7 PLATO *Symposium*, 163b-164c, the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

AUTHOR'S DIVISIONS One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference, line numbers, in brackets, are given in certain cases, e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows, e.g., OLD TESTAMENT *Nehemiah*, 7:45—(D) II Esdras, 7:46.

SYMBOLS The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference, "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style, for general guidance in the use of *The Great Ideas*, consult the Preface.

CROSS-REFERENCES

For: Other discussions of the principle of identity and of its significance for being, change, and thought, see BEING 2b, 7b(5); CHANGE 2; LOGIC 1a; ONE AND MANY 2a; PRINCIPLE 1c, 3a(3); RELATION 1a; and for the problems of personal identity and the identity of a state, see SOUL 1d; STATE 3g.

For: Other considerations of sameness or similarity, and of the problem of the reality of kinds or universals, *see* FORM 2a; IDEA 1a, 6b; ONE AND MANY 1c; UNIVERSAL AND PARTICULAR 2a-2c.

Matters relevant to the analysis of essential and accidental sameness, specific and generic sameness, and otherness in species or in genus, *see* EVOLUTION 1b; IDEA 4b(3); NATURE 1a(1); ONE AND MANY 3b(1); OPPOSITION 1c(2); RELATION 5a(4); UNIVERSAL AND PARTICULAR 5b.

The nature of the similitude between heterogeneous things, and for the problem of signifying such similitude, *see* BEING 1; SIGN AND SYMBOL 3d; and for the related distinction between univocal, equivocal, and analogical terms, *see* IDEA 4b(4); SIGN AND SYMBOL 3b-3d.

Another discussion of sameness by analogy or relational sameness, *see* RELATION 1d, 5a(3); and for sameness in quality and quantity, *see* QUALITY 3c, 4c; QUANTITY 1b.

Similitude in the relation of knower and known, of lover and loved, and in imitation, *see* ART 3; FORM 1d(1); KNOWLEDGE 1, 4d; LOVE 4a; NATURE 2a; ONE AND MANY 4f.

The principle of similarity in the association of ideas, *see* IDEA 5c; MEMORY AND IMAGINATION 2c; RELATION 4f; SENSE 3d(1).

The theory of definition as constituted by the statement of genus and difference, *see* DEFINITION 2b; NATURE 4a; OPPOSITION 1c(2).

The problem of the similitude between God and creatures, and for its bearing on the significance of the names we apply to God, *see* GOD 3f, 6a-6b; MAN 11a; NATURE 1b; ONE AND MANY 1b; SIGN AND SYMBOL 5f; WORLD 3a-3b.

ADDITIONAL READINGS

Listed below are works not included in *Great Books of the Western World*, but relevant to the idea and topics with which this chapter deals. These works are divided into two groups:

- I. Works by authors represented in this collection.
- II. Works by authors not represented in this collection.

For the date, place, and other facts concerning the publication of the works cited, consult the Bibliography of Additional Readings which follows the last chapter of *The Great Ideas*.

Chapter 83: SCIENCE

INTRODUCTION

IN our time, science, philosophy, and religion have come to represent three quite distinct intellectual enterprises. Each appeals for allegiance not merely on the ground that it can answer fundamental questions, but also because of its contribution to human life and culture. In other periods, philosophy and religion competed for supremacy, though, as appears in the chapter on PHILOSOPHY, some philosophers and theologians tried to remove this conflict by arguing for the complete compatibility of reason and faith. Nevertheless, before the 19th century, the issue, if one existed, was between philosophy and religion. Science had not yet become sufficiently distinct from philosophy to complicate the picture.

When science and philosophy are not themselves sharply distinguished, men are not confronted with three separate claims upon their intellectual allegiance. Modern science as something quite distinct in method and subject matter from traditional philosophy may actually make its appearance as early as the 17th century. But not until Kant are two kinds of science plainly set apart. Not until then are they so defined that one becomes identified with what men have always called "philosophy" and the other gradually appropriates the name of "science" and regards itself as a quite separate enterprise.

Kant differentiates between the empirical and the rational sciences. This differentiation tends to correspond with the distinction by others before him of experimental and abstract philosophy. It also corresponds with a later division into the experimental or inductive and the philosophical or deductive sciences. But Kant does not seem to contemplate the possibility of conflict between science and philosophy—between the experimental study of nature and metaphysics or, what is for him the

same, between empirical and rational physics.

Hume is willing to admit only mathematics to the status of a rational science, capable of demonstrating its conclusions with certainty. He insists upon experimental reasoning in the study of nature, wherein only probable conclusions can be attained. But he does not make these critical points in terms of science versus philosophy. If the traditional metaphysics is to be rejected, it is not because it is philosophy rather than science, but because it represents a failure in philosophy *or* science, resulting from the wrong method of dealing with matters of fact.

In the 19th century, however, Auguste Comte formulates a doctrine which, under the title of *Positive Philosophy*, explicitly declares that only the positive sciences—the study of natural, mental, and social phenomena by empirical methods—deserve to be called "sciences" in the eulogistic sense of that term. In contrast, philosophy is mere speculation, and religion is superstition. The word "speculation" is for the positivist only slightly less invidious than "superstition." Whereas superstition implies irrational belief, speculation represents a futile attempt by reason to go behind the phenomena in order to discover ultimate causes or substances. This cannot result in anything but guesswork or conjecture—never in knowledge or science, which are the same for the positivist. For all its show of logic and system, philosophy cannot produce conclusions which have the validity or objectivity of science, because it tries to do more than explore and describe the phenomena and because it tries to do whatever it does without investigation or experiment.

From many sources in addition to Comte similar views converge to form an attitude generally prevalent in the world today under the name of positivism. All its current varieties

seem to have this much in common: the identification of science with knowledge of fact, and further, the restriction of such knowledge to conclusions obtained and verified empirically. Whatever does not accord with this conception of science is either, like mathematics or logic, a purely formal discipline or, like philosophy and religion, it is conjecture, opinion, or belief—personal, subjective, even wishful.

IT SEEMS APPROPRIATE that the most recent author in the set of great books should provide us with a declaration of positivism and that he should set science against philosophy and religion. It is also fitting that he should be a scientist in the field of psychology, since psychology is a late-comer among the disciplines which, once branches of philosophy, now claim to be positive sciences. Not only late, but last, according to Freud, for "sociology, which deals with the behavior of man in society, can be nothing other than applied psychology. Strictly speaking, indeed, there are only two sciences—psychology, pure and applied, and natural science."

In his *New Introductory Lectures on Psycho-Analysis*, Freud concludes with a statement of what he calls the "scientific *Weltanschauung*." In essence, he thinks, "it asserts that there is no other source of knowledge of the universe, but the intellectual manipulation of carefully verified observations, in fact, what is called research, and that no knowledge can be obtained from revelation, intuition, or inspiration." Freud makes the drastic implications of this statement quite explicit. "It is inadmissible to declare," he writes, "that science is one field of human intellectual activity, and that religion and philosophy are others, at least as valuable, and that science has no business to interfere with the other two, that they all have an equal claim to truth, and that everyone is free to choose whence he shall draw his convictions and in which he shall place his belief.

"Such an attitude," he goes on, "is considered particularly respectable, tolerant, broad-minded, and free from narrow prejudices. Unfortunately, it is not tenable; it shares all the pernicious qualities of an entirely unscientific *Weltanschauung*, and in practice comes to much the same thing. The bare fact is that truth cannot be tolerant and cannot admit compromise

or limitations, that scientific research looks on the whole field of human activity as its own, and must adopt an uncompromisingly critical attitude towards any other power that seeks to usurp any part of its province."

As a threat to the dominion of science over man and society, "religion alone is a really serious enemy." Philosophy, Freud thinks, "has no immediate influence on the great majority of mankind"; whereas "religion is a tremendous force which exerts its power over the strongest emotions of human beings." Religion and science might be compatible if religion, offering men something "incomparably more beautiful, more comforting, and more ennobling than anything they could ever get from science," would only say: 'It is a fact that I cannot give you what men commonly call truth; to obtain that, you must go to science.'

But religion cannot say that, Freud thinks, without losing "all influence over the mass of mankind," and science cannot, on its side, yield at all in its claim to being the *only* avenue to truth. Employing a method which "carefully examines the trustworthiness of the sense perceptions on which it bases its conclusions," which "provides itself with new perceptions . . . not obtainable by everyday means," and which "isolates the determinants of these new experiences by purposely varied experimentation," science alone can "arrive at correspondence with reality." It is "this correspondence with the real external world we call truth"; and thus when "religion claims that it can take the place of science and that, because it is beneficent and ennobling, it must therefore be true, that claim is, in fact, an encroachment, which, in the interests of everyone, should be resisted."

Philosophy does not seem to Freud to offer men a genuine alternative to scientific truth. Unlike religion, it is not in his view necessarily opposed to science; at times it even behaves "as if it were a science," and to some extent makes "use of the same methods." But insofar as it parts company with science by clinging "to the illusion that it can produce a complete and coherent picture of the universe," philosophy must be regarded as an impostor in the halls of knowledge.

The picture philosophy tries to construct, Freud says, "must needs fall to pieces with

every new advance in our knowledge." Not itself knowledge, but mere opinion or speculation, philosophy does not, any more than religion, offer a substitute for science. Both together fall under Freud's interdict. Both together would be outcasts from human culture if what he calls "our best hope for the future," that is, "the intellect—the scientific spirit, reason—should in time establish a dictatorship over the human mind."

WILLIAM JAMES, ALMOST contemporary with Freud, also draws a sharp line between science and philosophy. Writing his *Principles of Psychology* at a time when the experimental methods of the natural sciences, especially physiology, have just been introduced into the study of mental phenomena, he is at pains to define the scope of psychology as a natural science, and to separate the questions which can be properly considered by a scientist from those which belong to the philosopher. But, unlike Freud, James does not seem to regard the philosopher as engaged in a futile effort to solve problems which are either insoluble or better left until science finds means for solving them.

For James the distinction between science and philosophy does not seem to lie only in the methods they employ, though the empirical or experimental approach does have a bearing on the kind of problems scientists can undertake to solve and the conclusions they can reach. The problems and the conclusions are themselves characteristically different from those of the philosopher.

The scientist *describes* the phenomena, according to James, as precisely as possible and as comprehensively, but without any implication of finality or totality. He recognizes that his descriptive formulations are tentative and incomplete, always subject to the discovery of new data or a more refined presentation of the evidence. Above all, he admits that he is only describing, not *explaining*—not laying bare the ultimate reality which gives the phenomena their deepest intelligibility, or ascertaining the causes which show why, not merely how, things happen as they do.

In the Preface to his *Principles*, James says that he has "kept close to the point of view of natural science throughout the book . . . This

book, assuming that thoughts and feelings exist and are vehicles of knowledge, thereupon contends that psychology, when she has ascertained the empirical correlation of the various sorts of thought or feeling with definite conditions of the brain, can go no farther—can go no farther, that is, as a natural science. If she goes farther, she becomes metaphysical. All attempts to *explain* our phenomenally given thoughts as products of deeper-lying entities . . . are metaphysical."

This scientific point of view, James admits, "is anything but ultimate. . . . The data assumed by psychology, just like those assumed by physics, must sometime be overhauled. The effort to overhaul them clearly and thoroughly is metaphysics." James does not imply that metaphysics cannot "perform her task well," but he does think that "she . . . spoils two good things when she injects herself into a natural science."

Science and metaphysics should be kept quite separate, even though the sciences, in accumulating "a mass of descriptive details," run "into queries which only a metaphysics alive to the weight of her task can hope successfully to deal with. That will perhaps be centuries hence; and meanwhile the best mark of health that a science can show is this unfinished-seeming front."

The variance of James' conception of metaphysics and its future from other traditional views on that subject is discussed in the chapter on METAPHYSICS. Here it is relevant to observe that James has a conception of science broad enough to include both the empirical natural sciences and what he calls the "pure or *a priori* sciences of Classification, Logic, and Mathematics." Yet in his view metaphysics does represent philosophy as opposed to science, because it aims at ultimate reality or underlying causes. For example, he rejects the theory of a soul, not because he knows it to be false, but because he thinks it has no place in "a psychology which contents itself with verifiable laws" and which is to "remain positivistic and non-metaphysical."

James seems to embrace the positivist view, prevalent in the 19th century and our own day. He limits science to, as well as excludes philosophy from, the domain of empirical

knowledge. In discussing the possibility of free will, he says that "Psychology will be Psychology and Science, Science, as much as ever (as much and no more) in this world, whether free-will be true in it or not. Science, however, must be constantly reminded that her purposes are not the only purposes, and that the order of uniform causation which she has use for, and is therefore right in postulating, may be enveloped in a wider order, in which she has no claims at all."

THOSE MODERN SCIENTISTS and philosophers who do not make a sharp distinction between science and philosophy and who antedate any explicit formulation of the positivist doctrine, nevertheless do for the most part conceive natural science as experimental in its method and as having for its goal the formulation of general laws describing and correlating the phenomena. They do not all exclude causes from the consideration of the natural scientist; nor do they all, as stringently as James, rule out explanation in favor of description or correlation. Furthermore, the almost universal emphasis by modern writers upon the experimental character of the natural sciences does not mean a universal identification of science with the experimental disciplines.

Mathematics, for example, is usually regarded as a science in spite of its being non-experimental. For Locke and Hume, as well as for Descartes, it exhibits certain characteristics — the self evidence of principles, the certainty of demonstrations — which make it more genuinely worthy of the high name of science than are the tentative hypotheses and probable conclusions of experimental physics. Other disciplines are called "sciences" by comparison with mathematics rather than physics. Descartes, for instance, seems to think that metaphysics can as surely be made a science as mathematics can be. Locke argues that demonstration from axioms is not limited to the science of quantity. As much clarity and certainty is attainable in reasoning about moral matters. Ethics is no less a science than mathematics.

Hobbes appears to take a similar view of politics, though it must be noted in his case that he differs from Descartes and Locke, from Bacon, Hume, and others in not distinguishing mathe-

matics from physics with respect to the latter's need for experimental evidence. All the sciences are for him alike in being "the demonstrations of consequences of one affirmation to another," regardless of "the diversity of the matter." The "certain and infallible" sign that a man is a scientist in any field of subject matter is that he can "demonstrate the truth thereof perspicuously to another."

Hobbes, furthermore, seems to think that what is true of geometry is true of every science, namely, that it must begin with definitions. "In geometry," he says, "men begin at settling the signification of their words; which settling of significations, they call *definitions*." Without definitions, science is impossible. "In the right definition of names," Hobbes maintains, "lies the first use of speech, which is the acquisition of science; and in the wrong, or no definitions, lies the first abuse, from which proceed all false or senseless tenets."

Freud expresses the opposite view, which is generally more characteristic of the attitude of the modern scientist, especially the experimentalist or empiricist in method. "The view is often defended," he writes, "that sciences should be built on clear and sharply defined basal concepts." But "in actual fact, no science, not even the most exact, begins with such definitions. The true beginning of scientific activity," Freud holds, "consists rather in describing phenomena and then proceeding to group, classify and correlate them. Even at the stage of description, it is not possible to avoid applying certain abstract ideas to the material in hand, ideas derived from various sources and certainly not the fruit of new experience only. . . . They must at first necessarily possess some measure of uncertainty; there can be no question of any clear limitation of their content. So long as they remain in this condition, we come to an understanding about their meaning by repeated references to the material of observation, from which we seem to have deduced our abstract ideas, but which is in point of fact subject to them."

The basic concepts or definitions of a science are, according to Freud, "in the nature of conventions; although," he adds, "everything depends on their being chosen in no arbitrary manner, but determined by the important

relations they have to the empirical material. . . . It is only after more searching investigation of the field in question that we are able to formulate with increased clarity the scientific concepts underlying it. . . . Then indeed, it may be time to immure them in definitions. The progress of science, however, demands a certain elasticity even in these definitions." This may not be true of mathematical concepts or definitions, but, Freud points out, the science of physics illustrates "the way in which even those 'basal concepts' that are firmly established in the form of definitions are constantly being altered in their content."

WITH THE EXCEPTION OF HOBBS, the notion that scientific conclusions can be drawn from definitions or can be established without recourse to experiment, is not usually extended by modern writers from mathematics and metaphysics to physics. As the chapter on PHYSICS shows, the basic division of the study of nature into philosophical and scientific physics becomes equivalent, in modern times, to a separation of the philosophy of nature from the experimental natural sciences. We shall return presently to that sense of "science" in which physics is associated with mathematics and metaphysics as a branch of theoretic philosophy or as one of the speculative sciences. All three disciplines are thought of as proceeding in the same way: by the demonstration of conclusions from principles obtained by induction from experience—ordinary sense-experience, that is, not the special experiences artificially contrived in a laboratory under experimental conditions. But it should be observed that, in the modern period, even those authors who use "science" in the foregoing sense when they discuss mathematics and metaphysics, treat physics differently. They hold that physics must be experimental if it is to be scientific.

In proportion as modern physics becomes more and more the model of science, the meaning of the word "science" tends to become reserved for experimental study, or at least for empirical investigation, so that non-experimental disciplines, like metaphysics or ethics, are questioned when they call themselves "sciences." Other disciplines try to establish themselves as sciences by imitating physics. Marx, for exam-

ple, in presenting his own work as economic science, seeks to explain how it can be scientific even if it is not experimental.

"The physicist," he writes, "either observes physical phenomena where they occur in their most typical form and most free from disturbing influence, or, wherever possible, he makes experiments under conditions that assure the occurrence of the phenomenon in its normality." If experiment, in the strict sense, is impossible in economics, at least the student of economics can be scientific in his effort to observe the phenomena "in their most typical form." England, Marx thinks, offers the most typical example of "the capitalist mode of production, and the conditions of production and exchange corresponding to that mode." Hence, for scientific purposes, he has used England "as the chief illustration in the development of [his] theoretical ideas."

THE EXPERIMENTAL CHARACTER of modern physics, whether it is called natural science or natural philosophy, is discussed in the chapter on PHYSICS. The distinction between the construction or use of experiments and the appeal to experience—apart from experiment—either as a source or as a test of scientific formulations, is discussed in the chapter on EXPERIENCE, as well as in the chapters on HYPOTHESIS and INDUCTION. Here it seems pertinent to note that neither the distinction between induction and deduction, nor the distinction between hypotheses and axioms, unequivocally marks the line which separates science from philosophy.

Aristotle and Bacon, for example, regard induction as the source of axioms in metaphysics or *philosophia prima* as well as in physics or the philosophy of nature. They may have different theories of induction, but only insofar as one conceives induction as an intuitive generalization from *ordinary sense-experience*, and the other makes induction an inference from *experiments*, does the difference between them seem to have a bearing on the distinction between philosophy and science.

Similarly, the difference between the scientist's and the philosopher's consideration of hypotheses seems to lie not in the role they play in reasoning or argument, but rather in their having or not having a special relation to experi-

mentation, either to guide it or to submit to its test.

Experiment, then, seems to be the distinguishing mark of science on the side of method; and, by an extension of meaning, even in those subject matters where experiments in the strict sense—in laboratories, with apparatus, under controlled conditions—are impossible, the scientist differs from the philosopher in an analogous point of method. The scientist investigates, does research, makes observations which go beyond the experiences which ordinary men have in the course of daily life.

It seems to be in this spirit that Newton opens the *Optics* with the statement that "my design in this book is not to explain the properties of light by hypotheses, but to propose and prove them by reason and experiments." In the same spirit Faraday says of himself: "As an experimentalist, I feel bound to let experiment guide me into any train of thought which it may justify; being satisfied that experiment, like analysis, must lead to strict truth if rightly interpreted; and believing also that it is in its nature far more suggestive of new trains of thought and new conditions of natural power."

Lavoisier imposes upon himself the rule "never to form any conclusion which is not an immediate consequence necessarily flowing from observation and experiment." Gilbert criticizes those who write about magnetism without recourse to experiments—philosophers who are not themselves investigators and have no first-hand acquaintance with things. Referring to "what has been held by the vulgar and by tradition" concerning the motion of the heart and arteries, Harvey proposes to separate true from false opinions "by dissection, multiplied experience and accurate observation."

Even a scientist like Fourier, who conceives physical theory as a kind of applied mathematics, says that "no considerable progress can hereafter be made which is not founded on experiments . . . for mathematical analysis can deduce from general and simple phenomena the expression of the laws of nature; but the special application of these laws to very complex effects demands a long series of exact observations." Like Fourier, Galileo also combines mathematics and experiment in the study of nature. But though he is willing to introduce experiments where they

are necessary in order to test rival hypotheses or alternative mathematical formulations of the laws of motion, he seems to express a preference for the rigor of purely mathematical physics.

In the Fourth Day of the *Two New Sciences*, discussing the parabolic path of projectiles, one person in the dialogue, Sagredo, says that "the force of rigid demonstrations such as occur only in mathematics fills me with wonder and delight." The understanding thus derived, he adds, "far outweighs the mere information obtained by the testimony of others or even by repeated experiment." Agreeing with this, Salviati, another person in the dialogue, claims that "the knowledge of a single fact acquired through a discovery of its causes prepares the mind to understand and ascertain other facts without need of recourse to experiment, precisely as in the present case, where by argumentation alone the Author proves with certainty that the maximum range occurs when the elevation is 45° . He thus demonstrates what has perhaps never been observed in experience, namely, that of other shots those which exceed or fall short of 45° by equal amounts have equal ranges."

THE CONCEPTION OF SCIENCE as consisting in a rigorous demonstration of conclusions from axioms—whether in mathematics or other subject matters—seems to be modern as well as ancient. It is found in Descartes and Spinoza, in Hobbes and Locke, as well as in Plato and Aristotle. Holding that "science in its entirety is true and evident cognition," Descartes may add that "it has been mathematicians alone who have been able to succeed in making any demonstrations, that is to say, producing reasons which are evident and certain"; yet he also hopes to make metaphysics a science after the model of mathematics.

This conception of science is somewhat qualified by Descartes when he discusses the study of nature. Here he tends toward experimentalism. Here he says that "experiments . . . become so much the more necessary the more one is advanced in knowledge." Referring to particular effects which "might be deduced from the principles in many different ways," he thinks that the only way to overcome the difficulty of discovering the principles on which the effects

do depend is "to try to find experiments of such a nature that their result is not the same if it has to be explained by one of the methods, as it would be if explained by the other."

On the other hand, the conception of science as knowledge founded upon experiment, or at least upon extended observation, seems to be ancient as well as modern. Aristotle criticizes those of his predecessors in physics whose "explanation of the observations is not consistent with the observations." The test of principles "in the knowledge of nature," he says, "is the unimpeachable evidence of the senses as to each fact." It is for this reason that he praises the method of Democritus as scientific.

"Lack of experience," Aristotle writes, "diminishes our power of taking a comprehensive view of the admitted facts. Hence those who dwell in intimate association with nature and its phenomena grow more and more able to formulate, as the foundations of their theories, principles such as to admit of a wide and coherent development; while those whom devotion to abstract discussions has rendered unobservant of the facts are too ready to dogmatize on the basis of a few observations. The rival treatments of the subject now before us will serve to illustrate how great is the difference between a 'scientific' and a 'dialectical' method of inquiry. For whereas the Platonists argue that there must be atomic magnitudes 'because otherwise 'The Triangle' will be more than one,' Democritus would appear to have been convinced by arguments appropriate to the subject, *i.e.*, drawn from the science of nature."

There are many passages in which Aristotle rejects an astronomical hypothesis because it does not account for the observations, or favors one theory against all others because it alone seems to fit the sensible phenomena. So, too, in his biological works, he makes experience the test of theories. Speaking of the generation of bees, for example, he says that if we ever learn the truth about this matter, "credit must be given to observation rather than to theories, and to theories only if what they affirm agrees with the observed facts." And in his treatise *On the Motion of Animals*, he calls for "reference to particulars in the world of sense, for with these in view we seek general theories, and with these we believe that general theories ought to harmonize."

But Aristotle also defines science as the certain demonstration of universal and necessary conclusions from self-evident principles. "Scientific knowledge," he writes, "is judgment about things that are universal and necessary; and the conclusions of demonstration . . . follow from first principles (for scientific knowledge involves apprehension of a rational ground)." The emphasis here is on knowledge of causes, and on the certainty and necessity of conclusions which can be demonstrated from axiomatic truths.

By these criteria, metaphysics and mathematics are, in Aristotle's conception of the three philosophical sciences, perfect examples of scientific knowledge; physics as a general philosophy of nature is also scientific knowledge in this sense; but the particular natural sciences, such as astronomy or zoology, are more empirical than philosophical in character. At least they involve admixtures of demonstration from principles with the verification of hypotheses by observation. To the extent that they are empirical, they are qualified by an uncertainty and a tentativeness in formulation which do not seem to be present in Aristotle's conception of the purely philosophical sciences.

It might even be said that the knowledge of nature which depends on empirical research is not strictly scientific at all. Locke appears to say just that. "How far soever human industry may advance useful and experimental philosophy in physical things," he writes, "scientific will still be out of our reach." Holding that "our knowledge of bodies is to be improved only by experience," Locke adds: "I deny not but a man accustomed to rational and regular experiments, shall be able to see farther into the nature of bodies, and guess righter at their yet unknown properties, than one that is a stranger to them; but yet, as I have said, this is but judgment and opinion, not knowledge and certainty. This way of getting and improving our knowledge in substances only by experience and history . . . makes me suspect that natural philosophy is not capable of being made a science."

WHETHER THE EXPERIMENTAL study of nature is the type of all scientific knowledge (in its object, its method, and the character of its conclusions) or whether, according to another conception, the philosophical disciplines are the

more perfect, perhaps even the only examples of science, there seems to be no question that different values attach to these two meanings of science—or, as it is currently expressed, to science and philosophy.

The philosophical sciences may be either theoretic or practical according as they aim at wisdom or at action, but they are seldom praised as being useful productively. The practical sciences which are also traditionally regarded as branches of moral philosophy—such as ethics, politics, and economics—may be knowledge put to use in the guidance of individual conduct or the affairs of society, but apart from poetics, which may direct production in the sphere of the fine arts, there does not seem to be any philosophical science, or branch of philosophy, that provides a mastery of matter or some control over nature. None has applications in the sphere of the useful arts.

As indicated in the chapters on ART, KNOWLEDGE, and PHILOSOPHY, Bacon appears to take a contrary view. Using the word “practical” to mean productive rather than moral or civil, he divides the philosophy of nature into speculative and practical branches. He regards mechanics as the application of physics to useful purposes, and finds a productive counterpart to metaphysics in what he calls “magic.”

Nor is Bacon's point merely that “the real and legitimate goal of the sciences is the endowment of human life with new inventions and riches,” in opposition to those whom he criticizes for thinking that “the contemplation of

truth is more dignified and exalted than any utility or extent of effects.” In addition he thinks that the truth of science can be tested by its productive utility. “That which is most useful in practice,” he writes, “is most correct in theory.”

Bacon's position with regard to the productive utility of science would not be contrary to the traditional view if by “the philosophy of nature” he meant science in the experimental rather than the philosophical sense. His emphasis upon experimentation in all parts of the study of nature suggests that that is the case. The fact that he places equal emphasis upon machinery and inventions and power over nature also suggests that technology is the other face of any science which is experimental in method.

Bacon and Descartes seem to be the first to perceive that knowledge which is experimental in origin must be by its very nature capable of technological applications. The instruments and apparatus which Bacon regards as necessary implements of science, no less than the machinery and inventions which science can be expected to produce, represent the very same techniques of operating upon nature. Experimental science is thus seen to be at once the creature and creator of technology. As Plato's *Republic* projects a society which cannot be realized unless it is ruled by the science of the philosopher, so Bacon's *New Atlantis* prophesies a civilization which the dominance of experimentalism and technology have brought to present reality.

OUTLINE OF TOPICS

	PAGE
1. Conceptions of science	691
1a. Science as a philosophical discipline: certain or perfect knowledge	
(1) The intellectual virtue of science: its relation to understanding and wisdom	
(2) The division and hierarchy of the philosophical sciences	692
1b. Science as the discipline of experimental inquiry and the organization of experimental knowledge: the scientific spirit	
(1) The utility of science: the applications of experimental knowledge in the mastery of nature; machinery and inventions	
(2) The effects of science on human life: the economic and social implications of technology	693
1c. The issue concerning science and philosophy: the distinction and relation between experimental and philosophical science, or between empirical and rational science	

2. The relation of science to other kinds of knowledge	694
2a. The relation between science and religion: the conception of sacred theology as a science	
2b. The comparison of science with poetry and history	
3. The relation of science to action and production	695
3a. The distinction between theoretic and practical science: the character of ethics, politics, economics, and jurisprudence as sciences	
3b. The distinction between pure and applied science: the relation of science to the useful arts	
4. The nature of scientific knowledge	696
4a. The principles of science: facts, definitions, axioms, hypotheses	
4b. The objects of science: the essential and necessary, the sensible and measurable	697
4c. The role of cause in science: explanation and description as aims of scientific inquiry	
4d. The generality of scientific formulations: universal laws of nature	698
4e. The certitude and probability or the finality and tentativeness of scientific conclusions: the adequacy of scientific theories	699
5. Scientific method	
5a. The role of experience: observation and experiment	
5b. Techniques of exploration and discovery: the ascertainment of fact	700
5c. The use of mathematics in science: calculation and measurement	
5d. Induction and deduction in the philosophy of nature and natural science	701
5e. The use of hypotheses: prediction and verification	
6. The development of the sciences	702
6a. The technical conditions of scientific progress: the invention of scientific instruments or apparatus	
6b. The place of science in society: the social conditions favorable to the advancement of science	
7. The evaluation of science	703
7a. The praise of science by comparison with opinion, superstition, magic	
7b. The satirization of science and scientists: the foibles of science	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER *Iliad*, BK II [265–283] 12d, the number 4 is the number of the volume in the set, the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES *Psychology*, 116a–119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example, in 7 PLATO *Symposium*, 163b–164c, the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right hand side of page 164.

AUTHOR'S DIVISIONS One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference, line numbers, in brackets, are given in certain cases, e.g., *Iliad*, BK II [265–283] 12d.

BIBLIOGRAPHIC REFERENCES The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by (D), follows; e.g., OLD TESTAMENT *Nehemiah*, 7:45 (D) *II Esdras*, 7:46.

SYMBOLS The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference, "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style, for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Conceptions of science

1a. Science as a philosophical discipline: certain or perfect knowledge

7 PLATO: *Republic*, BK V, 370d–373c, BK VI, 383d–388a; BK VII, 391b–398c / *Sophist*, 570a–574c esp 571a c / *Philebus*, 633a–635a esp 634b–635a

8 ARISTOTLE *Posterior Analytics* 97a–137a,c esp BK I, CH 2 97d–99a / *Physics*, BK I, CH I [184^a10–16] 259a; BK II, CH 7 275b d / *Metaphysics*, BK I, CH 2–3 500b–502d; BK II, CH I 511b,d 512b; BK IV, CH 2 [1004^b18–27] 523d; BK VI, CH I 547b,d–548c; BK XI, CH 7 592b–593a

9 ARISTOTLE *Ethics*, BK VI, CH 3 388b c; CH 6 389d

18 AUGUSTINE *City of God*, BK VIII, CH 2 9 265b–271a

19 AQUINAS *Summa Theologica*, PART I, Q 1, AA 1 8 3b–8d passim; PART I-II, Q 14, A 1, RLP 2 677b–678a

20 AQUINAS *Summa Theologica*, PART I-II, Q 54, A 4, REP 3 25b–d; Q 57, A 2 36a–37b; Q 60, A 5, REP 3 79b–80c; PART II-II, Q 9, A 2, ANS 424b–425a

23 HOBBS *Leviathan*, PART I, 60a–d; 65c–d; 71c–d; 72a–d, PART IV, 267a–c

31 DESCARTES *Rules*, II-III 2a–5a / *Discourse*,

PART I, 43d; PART II, 47a–48a, PART IV, 51b–52a / *Meditations*, I 75a–77c

31 SPINOZA *Ethics*, PART II, PROP 40–43 387a–389b PART V, PROP 25–28 458d–459b; PROP 31 459d 460b

35 LOCKE *Human Understanding*, BK IV, CH III, SECT 26 321b c; SECT 29 322c 323a

35 HUME *Human Understanding*, SECT IV, DIV 20 458a b

42 KANT *Pure Reason*, 1a–13d; 211c–218d; 243c–250a,c / *Fund. Prin. Metaphysic of Morals*, 253b c, 264b d; 270c d / *Practical Reason*, 360d–361d / *Pref. Metaphysical Elements of Ethics*, 365a–366a, 376c d / *Judgement*, 463a–467a, 560d–561a; 603a–b

1a(1) The intellectual virtue of science: its relation to understanding and wisdom

7 PLATO *Republic*, BK VI, 386d–388a

9 ARISTOTLE *Ethics*, BK VI, CH I-II 387a–393b

20 AQUINAS *Summa Theologica*, PART I-II, Q 54, A 4, REP 3 25b–d; Q 57, A 2 36a–37b; Q 64, A 3 68b–69b; Q 66, A 5 79b–80c

23 HOBBS *Leviathan*, PART I, 66c d; 68b

31 DESCARTES *Rules*, I 1a–2a

31 SPINOZA *Ethics*, PART II, PROP 40–43 387a–389b, PART V, PROP 25–28 458d–459b; PROP 31 459d 460b

(1a. Science as a philosophical discipline: certain or perfect knowledge.)

1a(2) The division and hierarchy of the philosophical sciences

Chapter 84: SENSE

INTRODUCTION

THE nature of sensation seems at first to be as obvious as its existence. In the tradition of the great books there may be controversy concerning the existence of sense in plants as well as in animals, and there may be controversy over the existence in man of faculties higher than sense. But no one disputes that men and other animals are endowed with a power of sense.

The extent of this power may be questioned, but not the fact that animals and men, when awake, experience sensations or perceive through their senses. Sleep, according to Aristotle, can occur only in those living things which have the power of sense-perception. "If there be an animal not endowed with sense-perception, it is impossible that this should either sleep or wake, since both these are affections of the activity of the primary faculty of sense-perception."

The existence of the sensible—of an external something which causes sensation and can be sensed—also seems to escape denial or dispute. The existence of a purely intelligible reality—of a world of immaterial things incapable of being sensed—is subject to debate in all periods of western thought. The sensible world is sometimes regarded as the only reality; sometimes it is regarded as mere seeming, or appearance, in comparison with the reality of purely intelligible being. Men may also differ on the question whether things possess sensible qualities when they are not being sensed. But with few exceptions, notably Berkeley and Hume, the existence of a sensible world of material things is not denied or seriously doubted.

The controversies and issues indicated above are, for the most part, discussed elsewhere. The chapter on ANIMAL considers the sensitivity of plants. There also, as well as in the chapters on MAN, IDEA, and MIND, is considered the distinc-

tion between the senses and the higher faculties of reason or intellect. The chapter on MEMORY AND IMAGINATION deals with these two functions in their relation to sense and sense-perception; and the contrast between sensible and intelligible reality is discussed in the chapters on BEING, FORM, IDEA, and MATTER. Some of these topics necessarily recur here, especially as they bear on what for this chapter are the primary problems—the nature of sensation, the analysis of the power of sense, and the character of the knowledge which is afforded by the senses.

AS WE HAVE ALREADY observed, no difficulty seems to arise at first concerning the nature of sensation. It is supposed by many inquirers, early and late in the tradition, that matter is sensitive as well as sensible. Animals have sense-organs which react to physical stimulation. Bodies either act directly upon the sense-organs, as in the case of touch and taste; or, as in the case of vision, hearing, and smell, they exert their influence through an intervening medium, yet in a manner which seems to be no less the action and reaction of bodies.

Those who distinguish between living organisms and inanimate bodies tend to regard sensitivity as a property of living matter, but it does not follow for all who make this distinction that other than material factors are needed to explain sensation. On the contrary, some writers seem to think that the motions of matter account for sensation as readily as the laws of mechanics account for all the sensible changes we are able to perceive.

Lucretius, for example, holds that living things consist of body and soul, and that the soul (or mind) differs from the body only in the size, the fineness of texture, and the mobility of the material particles which compose it. It

is, he says, "by the common motions of the two"—body and soul—that "sensation is kindled and fanned throughout our flesh." Sensation occurs when the particles of body and soul together are set in motion by the impact of external bodies upon the organs of sense. "When the pupil of the eye receives in itself a certain kind of blow, it is said to perceive white color, and another again when it perceives black." Similarly, "every kind of sound and voice is heard when they have found their way into the ears and struck upon the sense with their body; for that voice, too, and sound are bodily you must grant, since they can strike on the senses."

Either the external body itself, as in touch, strikes the sense and sets up those bodily motions in the animal which are sensation; or, according to Lucretius, minute replicas or images—composed of atoms, as all things are—fly off from the surface of distant bodies and enter through the pores of our sense-organs to awaken in us vision, hearing, or smell. In either case, sensation is a bodily reaction; and, for Lucretius, imagination and memory, even thought, are consequent motions in the atoms of the mind—further bodily reverberations, as it were, of sensation.

"The cause of sense," writes Hobbes, "is the external body or object, which presses the organ proper to each sense, either immediately, as in taste and touch, or mediately, as in seeing, hearing, and smelling; which pressure, by the mediation of nerves, and other strings and membranes of the body, continues inwards to the brain and heart, causes there a resistance or counter-pressure, or endeavor of the heart, to deliver itself; which endeavor, because outward, seems to be some matter without. And this *seeming* or *fancy* is that which men call *sense*."

The object seems to be colored or hot or sweet when it causes certain sensations in us which are projected outward upon it, in response or counter-action to the inward motions it sets up. But, says Hobbes, these sensible qualities are, in the object, nothing but "so many several motions of the matter by which it presses our organs diversely. Neither in us that are pressed, are they anything else but diverse motions (for motion produces nothing but motion)."

THE FOREGOING THEORY, reducing sensation to bodily motion, seems to draw its cogency from the fact that only bodies are sensible, that sense-organs are bodily parts, and that sense-organs must be activated by some sort of physical contact for sensations to occur. Some writers, like Descartes, accept the theory for animals, but reject it for men; or they distinguish, in the case of men, between thought and sensation. They regard sensation, with its subsidiary functions of memory and imagination, as reducible to corporeal motions, but refuse to grant that external sense-impressions or interior fancy can produce knowledge without the activity of an immaterial soul.

To animals, Descartes declares, "we can ascribe . . . no knowledge at all, but only fancy of a purely corporeal kind." In contrast, "that power by which we are said to know things is purely spiritual, and not less distinct from every part of the body than blood from bone, or hand from eye." In men as well as animals, the external senses, "in so far as they are part of the body . . . perceive in virtue of passivity alone, just in the way that wax receives an impression from a seal." Fancy or imagination is also "a genuine part of the body"; and "memory, at least that which is corporeal and similar to that of the brutes, is in no respect distinct from imagination."

These corporeal faculties are, according to Descartes, of use to the understanding or the mind only when it "proposes to examine something that can be referred to the body"; but if it "deal with matters in which there is nothing corporeal or similar to the corporeal, it cannot be helped by those faculties." Hence, for Descartes, the "mind can act independently of the brain; for certainly the brain can be of no use in pure thought; its only use is for imagining and perceiving."

For others, like William James, the distinction between sensation and thought, so far as their relation to matter is concerned, seems quite untenable. He objects to those who look upon sensational consciousness as "something *quasi*-material, hardly cognitive, which one need not much wonder about," while they regard rational consciousness as "quite the reverse, and the mystery of it [as] unspeakable." We can correlate consciousness with the brain's

workings only in an empirical fashion, James thinks, and we ought to confess that "no glimmer of explanation of it is yet in sight. That brains should give rise to a knowing consciousness at all, this is the one mystery which returns, no matter of what sort the consciousness or of what sort the knowledge may be. Sensations, aware of mere qualities, involve the mystery as much as thoughts, aware of complex systems, involve it."

Still others, like Plotinus and Aristotle, think that the mystery of conscious matter is not essentially different from the mystery of living matter, for if there is anything mysterious about nutrition and growth, or sensation and imagination, it consists in the same thing—the union of material and immaterial principles, of body and soul.

"If the soul were a corporeal entity," Plotinus writes, "there could be no sense-perception, no mental act, no knowledge. . . . If the sentient be a material entity (as we are invited to believe), sensation could only be of the order of seal-impressions struck by a ring on wax." Perception is not a passively received impression. It is, according to Plotinus, an act of awareness "determined by the nature and character of the living being in which it occurs. . . . In any perception we attain by sight, the object is grasped there where it lies in the direct line of vision. . . . The mind looks outward; this is ample proof that it has taken and takes no inner imprint, and does not see in virtue of some mark made upon it, like that of the ring on the wax; it need not look outward at all if, even as it looked, it already held the image of the object, seeing by virtue of an impression made upon itself."

According to Aristotle, "two characteristic marks have above all others been recognized as distinguishing that which has soul in it from that which has not—self-movement and sensation." By self-movement he appears to mean such things as the nutrition and growth which is found in plants, as well as the additional animal faculty of local motion. Both self-movement and sensation require soul as well as body. "Nothing grows or decays naturally," he writes, "except what feeds itself, and nothing feeds itself except what has a share of soul in it." So, too, "nothing except what has soul in

it is capable of sensation." But "the exercise of sense-perception does not belong to soul or body exclusively." Sensation "is not an affection of the soul" by itself, nor has a soulless body "the potentiality of perception."

BUT, ARISTOTLE ASKS, are all affections of the soul "affections of the complex of body and soul, or is there any one among them peculiar to the soul by itself? . . . If we consider the majority of them, there seems to be no case in which the soul can act or be acted upon without involving the body; e.g., anger, courage, appetite, and sensation generally. Thinking seems to be the most probable exception; but if this too proves to be a form of imagination, or to be impossible without imagination, it too requires a body as a condition of its existence."

Aquinas tries to answer the question Aristotle asks, with a threefold distinction which places sensation and imagination midway between the vegetative functions and rational thought. The power of thought, or "the intellectual power," Aquinas says, "does not belong to a corporeal organ, as the power of seeing is the act of the eye; for understanding is an act which cannot be performed by a corporeal organ, like the act of seeing."

At the other extreme from this "operation of the soul which so far exceeds the corporeal nature that it is not even performed by any corporeal organ," are those "operations of the soul . . . performed by a corporeal organ and by virtue of a corporeal quality." Because it is a kind of self-movement, digestion requires soul as well as body, but it is a corporeal action in the way in which, according to Aquinas, it involves "the action of heat." Between these extremes, Aquinas places sensation and imagination, operations "performed through a corporeal organ, but not through a corporeal quality."

He explains this further by means of a distinction between natural and spiritual immutation—physical and psychic change. "Natural immutation takes place by the form of the thing which causes the immutation being received, according to its natural existence, into the thing in which the immutation is effected, as heat is received into the heated thing." Vegetative activities, while remaining psychic in the sense of occurring only in living or be-

souled matter, involve only natural immutations in the vital organs involved.

In contrast, "spiritual immutation takes place by the form of the thing causing the immutation being received, according to a spiritual mode of existence, into the thing in which the immutation is effected, as the form of color is received into the eye, which does not thereby become colored." Though some sensations may require a natural immutation of the sense-organ, as hot and cold do, all sensations necessarily involve a spiritual immutation, which enables the sense-organ to perform its proper act of knowing, as the eye knows color without becoming colored. "Otherwise," Aquinas says, "if a natural immutation alone sufficed for the sense's action, all natural bodies would feel when they undergo alteration."

THESE DIVERSE VIEWS of the nature of sensation seem to be paralleled by diverse views of the sensitive faculty. That the function of the senses is somehow to apprehend or know does not seem to be disputed. But whether the senses—including memory and imagination—are the only faculty of knowing is an issue to which the great books seem to give a variety of answers.

The opposite answers appear to be correlated, not only with conflicting positions in respect to body and soul, but also with opposing theories of the distinction between men and other animals. Those who hold that the motions of matter are adequate to explain the phenomena of knowing and thinking, tend to make sense-perception the primary function of the mind and to treat not only memory and imagination, but also reasoning or thought as subsequent activities of the same general faculty which receives impressions from external sources in the first instance. Since other animals possess senses and give evidence that perception in them has consequences for memory and imagination, those who hold this view also tend to attribute thought to animals and to regard man as differing from them only in degree.

Those who take the contrary view that knowing involves an immaterial principle or cause—a soul as well as a body—tend to distinguish the various functions of sense from the activities of thought—such as conception,

judgment, and reasoning. They also take the position that man, while sharing sense-perception, memory, and imagination with other animals, alone possesses the higher faculty. The difference between men and brutes is thus conceived as one of kind, not of degree, when the difference between the senses and the reason in man is also conceived as a difference in kind. A functional relationship between sensation and thought is not thereby denied, but a distinct faculty is affirmed to be necessary for going beyond the apprehension of particulars to knowledge of the universal, or for rising above the imagination to abstract thought.

The distinction between sense and reason as faculties of knowing is sometimes stated in terms of a difference in their objects—the particular versus the universal, becoming versus being, the material versus the immaterial. Sometimes it is stated in terms of the difference between a corporeal power requiring a bodily organ and a spiritual power which belongs exclusively to the soul. Sometimes it is stated in terms of the contrast between sense as intuitive and reason as discursive, the one beholding its objects immediately, the other forming concepts, judgments, or conclusions about objects which are either beheld by the senses or cannot be intuitively apprehended at all.

The exceptions to the foregoing summary are almost as numerous as the exemplifications of the points mentioned. Nothing less than this intricate pattern of agreements and differences will serve, however, to represent the complexity of the discussion and the way in which diverse theories of sense imply different views of nature and man, of mind and knowledge. The situation can be illustrated by taking certain doctrines which seem to be opposite on most points, and then considering other theories which seem to agree, on this point or that, with both extremes.

WE HAVE ALREADY observed the opposition between Hobbes and Aquinas with regard to matter and spirit in relation to the activity of the senses. Hobbes, like Lucretius, not only treats all mental phenomena as manifestations of bodily motion, but also reduces thought to the train or sequence of images. Images are in turn reducible to the sensations from which they derive.

"As we have no imagination," Hobbes writes, "whereof we have not formerly had sense, in whole or in parts; so we have no transition from one imagination to another, whereof we never had the like before in our senses." Using the word "thoughts" to stand for the images derived from sense, Hobbes goes on to say that "besides sense, and thoughts, and the train of thoughts, the mind of man has no other motion; though by the help of speech and method, the same faculties may be improved to such a height as to distinguish men from all other living creatures."

Only man's use of words makes the difference in the exercise of the imagination "that we generally call understanding," and which, according to Hobbes, "is common to man and beast." Similarly, it is only the fact that common names have general significance which gives human discourse the appearance of abstract thought, for Hobbes denies abstract ideas. Thoughts or images are no less particular than sensations, "there being nothing in the world universal but names."

Berkeley and Hume seem to agree with Hobbes that man has no abstract ideas or universal concepts; that all the operations of thought are merely elaborations of the original impressions of sense; and that no special power, but only the use of language, distinguishes men from other animals.

Berkeley uses the word "idea" to stand for sense-impressions—"ideas actually imprinted on the senses"—and for whatever is "perceived by attending to the passions and operations of the mind." To these two he adds a third: "ideas formed by the help of memory and imagination, either compounding or dividing, or barely representing those originally perceived in the aforesaid ways." The only difference between the first and the third is that "the ideas of sense are more strong, lively, and distinct than those of the imagination." But our ideas of sense and imagination do not cover all the objects of which we can think. He admits, therefore, the possibility of our having *notions*, whereby we understand the meaning of a word like "spirit" or "soul" which refers to a substance of which we can form no idea.

Hume divides "all the perceptions of the mind into two classes or species, which are dis-

tinguished by their different degrees of force and vivacity. The less forcible and lively are commonly denominated *thoughts* or *ideas*." The other he calls "impressions," meaning thereby "all our more lively perceptions." Impressions are the source of all other ideas, the creative power of the mind consisting in "no more than the faculty of compounding, transposing, augmenting, or diminishing the materials afforded us by the senses" and every simple idea being "copied from a similar impression."

Yet, though Berkeley and Hume seem to agree with Hobbes in reducing all thought to primary sense-perceptions and derived memories or imaginations, Hume does not attempt to explain thought by the motions of matter. Berkeley differs even more radically. He denies that matter or bodies exist, and so he regards sense-perception, like all the rest of thought, as purely spiritual. The soul passively receives its original impressions directly from God and actively forms the ideas it is able to derive from these impressions.

NOR DO ALL THOSE who somehow conceive man as composed of both body and soul agree upon the function of sense in relation to the rest of thought. Locke, for example, uses "understanding" to cover all sorts of mental activity. Mental activity begins with the passive reception of the simple ideas of sense—the impressions produced in us when "the bodies that surround us do diversely affect our organs"—and the simple ideas of reflection which arise from an awareness of our own mental operations. But mental activity also includes the formation of complex ideas by the compounding of simple ones, and even the act whereby we form abstract ideas, in doing which man, in Locke's opinion, is distinguished from brutes.

All these activities require soul as well as body. All are somehow nothing more than a reworking of the original sensations passively received. In this last respect, Locke's view accords with that of Hobbes, Berkeley, and Hume, though he differs from them with respect to abstract ideas and in his theory of body and soul. On the very point which he holds in common with Hobbes, Berkeley, and Hume, Locke seems to disagree with Descartes.

Thinking, for Descartes, is the activity of a

purely spiritual substance—the rational soul—peculiar to the dual nature of man; whereas sensation and imagination, common to men and brutes, are purely corporeal functions. In man, the soul or thinking substance may form certain of its ideas, those relative to bodies, under the influence of sense or fancy; but with regard to other ideas, such as those we have of geometrical figures, Descartes says he cannot admit that they “have at any time entered our minds through the senses.” He objects to the use of the word “idea” for images, or what he calls “pictures in the corporeal imagination, *i.e.*, in some part of the brain.” He criticizes those who “never raise their minds above the things of sense,” so accustomed are they “to consider nothing except by imagining it,” with the result that whatever “is not capable of being imagined appears to them not to be intelligible at all.”

Against the maxim which Locke, no less than Hobbes or Berkeley, would approve—that “there is nothing in the understanding which has not first of all been in the senses”—Descartes offers the ideas of God and of the soul as plainly contrary examples, ideas clearly in the mind which have no origin in sensation or fancy. “Those who desire to make use of their imagination to understand these ideas,” he adds, “act in the same way as if, to hear sounds or smell odours, they should wish to make use of their eyes.”

In making a sharp distinction between the faculties of sense and understanding or reason, Descartes seems to share the position of Plato, Aristotle, Aquinas, Spinoza, and Kant. Yet for Descartes as for Plato, the intellect in its own sphere of objects is like the senses in theirs, since each is able to behold its proper objects intuitively; whereas for Kant as for Aristotle, sense alone is a faculty of intuition. The ideas by which we apprehend intelligible objects, according to Plato, Descartes, and Spinoza, are not derived from sensations or images. According to Aristotle and Aquinas, on the other hand, the intellect abstracts all its ideas, or universal concepts, from the particulars of sense.

In this respect Aristotle and Aquinas seem to be in agreement with Locke, even though that agreement must be qualified by the observa-

tion that Locke sees no need for a special faculty to obtain abstract ideas. On the other hand, Plato, Aristotle, Aquinas, and Descartes all seem to agree in holding that understanding is as immaterial as its objects. Unlike sense, which requires bodily organs, rational thought is, according to them, an activity peculiar either to the soul itself or to a power of the soul which is not embodied in an organ, as the power of vision is embodied in the eye or the powers of memory and imagination are embodied in the brain.

William James denies this. He holds the view that all forms of consciousness are somehow functions of the brain. Yet he also insists that percept and concept are radically distinct forms of consciousness. To this extent, James makes as sharp a separation as the authors above mentioned between the sensory and the rational phases of thought. He places sensation, perception, memory and imagination on one side, and conception, judgment, and reasoning on the other. But this is for him not a distinction of faculties or powers, but only of different functions which one and the same mind is able to perform.

CERTAIN POINTS OR problems in the traditional discussion of sense are unaffected by the basic issues just considered. For example, most writers tend to make some distinction between the special exterior senses, such as vision and hearing, touch and taste, and the several interior senses, which Aquinas enumerates as the common sense, memory, imagination, and the estimative or cogitative powers. Yet not all who consider memory and imagination as activities consequent upon sense-perception call them “interior senses.” Not all recognize a distinct estimative or cogitative power even when they recognize a kind of thinking about particulars done by animals and men with sensory materials. Nor do all who discuss discrimination or comparison, and the collation or combining of the impressions received from the special senses, attribute these functions to the special faculty which Aristotle first calls “the common sense.”

Frequently the same analytical point is made in different ways. As indicated in the chapter on QUALITY, the distinction which Aristotle

and Aquinas make between proper and common sensibles, according as the quality, such as color and odor, belongs to a single sense, or, like shape and motion, can be perceived by two or more senses, seems to parallel the distinction between what Locke calls "secondary" and "primary" qualities. But where Locke and others treat the so-called "secondary qualities" as entirely subjective, occurring only in the experience of the sentient organism and having no reality in the sensible thing, Aristotle takes a contrary view.

When it is not actually seen or smelled, the sensible thing, according to Aristotle, is potentially colorful or odoriferous; just as when it is not actually seeing or smelling, the sense of vision or smell is also in a state of potentiality with respect to these qualities. But when the sensible thing is actually sensed, then, Aristotle says, "the actuality of the sensible object and of the sensitive faculty is *one* actuality." The thing is actually colored when it is actually seen, though it is only potentially colored when it is merely able to be so seen. "Earlier students of nature," he writes, "were mistaken in their view that without sight there was no white or black, without taste no savor. This statement of theirs is partly true, partly false: 'sense' and 'the sensible object' are ambiguous terms, *i.e.*, they may denote either potentialities or actualities. The statement is true of the latter, false of the former."

Another example of the same analytical point (which is made differently by different writers) concerns the distinction between sensation and perception. According to William James, "perception involves sensation as a portion of itself, and sensation in turn never takes place in adult life without perception also being there." The difference between them is that the function of sensation is "that of mere acquaintance with a fact," whereas "perception's function . . . is knowledge *about* a fact, and this knowledge admits of numberless degrees of complication." Hearing a sound is having a sensation, but perception occurs when, as James points out, we "hear a sound, and say 'a horse-car.'"

But James does not agree that, when perception is so described, it is, as other psychologists have suggested, a species of reasoning. "If, ev-

ery time a present sign suggests an absent reality to our mind, we make an inference, and if every time we make an inference we reason; then," James admits, "perception is indubitably reasoning. Only one sees no room in it for any unconscious part." No inference is consciously made in perception; and James thinks that "to call perception unconscious reasoning is either a useless metaphor, or a positively misleading confusion between two different things." In his opinion, "perception differs from sensation [simply] by the consciousness of further facts associated with the object of sensation." For him, "perception and reasoning are coordinate varieties of that deeper sort of process known psychologically as the association of ideas."

What James treats as the object of sensation, Aristotle refers to as a quality sensed by one or more of the special senses, either a proper or a common sensible. What James treats as the object of perception, Aristotle calls an "accidental object of sense," because it is strictly not sensible at all by any of the exterior senses, singly or in combination. When we call "the white object we see" the son of Diogenes or a man, we have an example of an accidental sensible or an object incidentally perceived, because "being the son of Diogenes" is incidental to the directly visible white patch we see with our eyes.

This distinction between sensation and perception seems to have a bearing on the problem of the fallibility of the senses. Again the same point seems to be differently made. Aristotle, for example, holds that whereas each of the senses is normally infallible in the apprehension of its proper object or appropriate quality, error is possible in the perception of the complex thing which is not strictly an object of the special senses. "While the perception that there is white before us cannot be false," he writes, "the perception that what is white is this or that may be false."

Lucretius likewise insists that the senses themselves are never deceived, but that all the errors attributed to the senses are the result of a false inference or judgment which reason makes on the basis of the evidence presented by the senses. That also seems to be the opinion of Descartes, who thinks that "no direct experience can ever deceive the understanding if

it restricts its attention accurately to the object presented to it. . . . Thus if a man suffering from jaundice persuades himself that the things he sees are yellow, this thought of his will be composite, consisting partly of what his imagination presents to him, and partly of what he assumes on his own account, namely, that the color looks yellow, not owing to the defect in his eye, but because the things he sees really are yellow. . . . We can go wrong only when the things we believe are in some way compounded by ourselves." Descartes holds that "no falsity can reside" in sensations themselves, but only in those judgments which, on the basis of sensations, we are "accustomed to pass about things external to us."

THE MOST FUNDAMENTAL judgment which men make on the basis of sensation is that an external world exists—a reality not of our own making. Descartes argues from the evidence of the senses to the independent existence of a world of bodies. Though Berkeley argues, on the contrary, that bodies do not exist except as objects of perception, he attributes the sense-impressions, over which we seem to have no control, to the action of an external cause—to God, who uses them as signs for instructing us.

Locke defines sensitive knowledge as that which informs us of "the existence of things actually present to our senses." We may know

our own existence intuitively, and God's existence demonstratively, but "the knowledge of the existence of any other thing we can have only by sensation." And though, he adds, "the notice we have by our senses of the existing of things without us . . . be not altogether so certain as our intuitive knowledge or the deductions of our reason . . . yet it is an assurance that deserves the name of knowledge."

Against such views, the most fundamental skepticism goes further than doubting the veracity of the senses because of the illusions and hallucinations they cause us to suffer. "By what arguments," Hume asks, "can it be proved that the perceptions of the mind must be caused by external objects . . . and could not arise either from the energy of the mind itself or from the suggestion of some visible or unknown spirit?"

"It is a question of fact," he adds, "whether the perception of the senses be produced by external objects, resembling them. How shall this question be determined? By experience surely; as all other questions of a like nature. But here experience is, and must be, entirely silent. The mind has never anything present to it but the perceptions, and cannot possibly reach any experience of their connexion with objects. The supposition of such a connexion is, therefore, without any foundation in reasoning."

OUTLINE OF TOPICS

	PAGE
1. The nature of sense	715
1a. The power of sense as distinct from the power of understanding or reason	
1b. Sense and intellect in relation to becoming and being, particulars and universals	
1c. The distinction between perception or intuition and judgment or reasoning: the transcendental forms of intuition	716
1d. Sense-perception as a primary function of the mind or understanding: sensations as received impressions; the distinction between sensation and reflection, ideas and notions, percepts and concepts	
2. Sensitivity in relation to the grades of life	
2a. The differentiation of animals from plants in terms of sensitivity	
2b. The degrees of sensitivity in the animal kingdom: the genetic order of the several senses	717
2c. Comparisons of human and animal sensitivity	

3. The analysis of the power of sense: its organs and activities	717
3a. The anatomy and physiology of the senses: the special sense-organs, nerves, brain	
3b. The distinction between the exterior and interior senses	718
(1) Enumeration of the exterior senses: their relation and order	
(2) Enumeration of the interior senses: their dependence on the exterior senses	
3c. The activity of the exterior senses	
(1) The functions of the exterior senses: the nature and origin of sensations	
(2) The attributes of sensation: intensity, extensity, affective tone; the psychophysical law	719
(3) The classification of sensations or sense-qualities: proper and common sensibles; primary and secondary qualities	
(4) The distinction between sensation and perception: the accidental sensible; complex ideas of substance	720
(5) Sensation and attention: pre-perception and apperception; the transcendental unity of apperception	
3d. The activity of the interior senses	
(1) The functions of the common sense: discrimination, comparison, association, collation or perception	
(2) Memory and imagination as interior powers of sense	
(3) The estimative or cogitative power: instinctive recognition of the harmful and beneficial	721
3e. The relation of sense to emotion, will, and movement: the conception of a sensitive appetite	
4. The character of sensitive knowledge	722
4a. Comparison of sensitive with other forms of knowledge	
4b. The object of sense-perception: the evident particular fact; judgments of perception and judgments of experience	
4c. The relation of sense and the sensible: the subjectivity or objectivity of sense-qualities	723
4d. The limit, accuracy, and reliability of sensitive knowledge: the fallibility of the senses	
(1) The erroneous interpretation of sense-data: the problem of judgments based on sensation	724
(2) Error in sense-perception: illusions and hallucinations	
5. The contribution of the senses to scientific or philosophical knowledge	
5a. Sensation as the source or occasion of ideas: the role of memory or reminiscence; the construction of complex ideas; the abstraction of universal concepts	725
5b. Sense-experience as the origin of inductions	726
5c. The dependence of understanding or reason upon sense for knowledge of particulars: verification by appeal to the senses	
6. The role of sense in the perception of beauty: the beautiful and the pleasing to sense; sensible and intelligible beauty	727

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT.) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLICAL REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference, "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 85: SIGN AND SYMBOL

INTRODUCTION

A SIGN points to something. A symbol stands for or takes the place of another thing. Sign and symbol are sometimes differentiated according to whether emphasis is placed on that which is signified or pointed out, or on that which functions as a surrogate or substitute.

Yet "sign" and "symbol" are often used interchangeably. We call the notations of music or mathematics either "signs" or "symbols." Words, too, are traditionally spoken of as signs or symbols. Words and other conventional notations for expressing meaning both point to and stand for something else. It is only in certain cases that one of these two functions seems to predominate, as the road marker points out the direction to take, and paper money takes the place of the precious metal whose value it represents.

On what is common to signs and symbols of all sorts there seems to be no disagreement throughout the tradition of western thought. From Augustine's statement that "a sign is a thing which, over and above the impression it makes on the senses, causes something else to come into mind as a consequence of itself," to Freud's analysis of the symbolism of dreams, of symptoms, and symptomatic acts, the great books consider sign or symbol as one term in a relation, the relation being one of meaning or, as Freud says, of "significance, intention, tendency." The fundamental problems traditionally discussed concern the nature of meaning itself, and the modes of signification which vary with the kinds of things that function as signs and the kinds of things they signify.

WITH RESPECT TO THINGS which function symbolically, the primary distinction seems to be that between natural and conventional signs. Augustine at first suggests a threefold division.

Some things are simply things, and not signs at all. Some (for example, "the ram which Abraham offered up instead of his son") are not only things, but "also signs of other things." And some things, such as words, "are never employed except as signs." Augustine adds that words are not merely signs. "Every sign," he writes, "is also a thing, for what is not a thing is nothing at all."

The distinction between natural and conventional signs falls within this threefold division. "Natural signs," Augustine says, "are those which, apart from any intention or desire of using them as signs, do yet lead to the knowledge of something else, as, for example, smoke when it indicates fire. For it is not from any intention of making it a sign that it is so, but through attention to experience we come to know that fire is beneath, even when nothing but smoke can be seen. And the footprint of an animal passing by belongs to this class of signs."

Augustine seems to find natural signs in things that are related as cause and effect. Berkeley, on the other hand, tends to substitute the relation of sign and thing signified for the relation of cause and effect. "The fire which I see," he writes, "is not the cause of the pain I suffer upon my approaching, but the mark that forewarns me. In like manner the noise that I hear is not the effect of this or that motion or collision of the ambient bodies, but the sign thereof."

Every natural thing or event thus tends to become the sign of something else, so that the whole of nature constitutes a vast symbolism or language by which God informs us of his plan. Aristotle tends, in the opposite direction, to limit natural signs to those things which, according to our knowledge and experience, permit a necessary or probable inference to something else. The fact that a woman is giving milk

he regards as an infallible sign that she has lately borne a child; the fact that a man is breathing fast is merely a probable and refutable sign that he has a fever.

In any case, signs are generally acknowledged to be natural if they satisfy Augustine's criterion that they were not intentionally devised by men for the purpose of signifying. "Conventional signs, on the other hand," he writes, "are those which living beings mutually exchange for the purpose of showing, as well as they can, the feelings of their minds, or their perceptions, or their thoughts." Of conventional signs, Augustine goes on to say, words hold the chief place, because everything which can be expressed by gestures, or by such non-verbal symbols as flags or bugle calls, can also be expressed in words, whereas many thoughts which words readily express do not lend themselves easily to other modes of expression.

Except for the hypothesis (discussed in the chapter on LANGUAGE) of a natural form of speech common to all men and consisting of words perfectly adapted to the objects they name, it is never proposed that words are anything but conventional signs. As Aristotle says, "nothing is by nature a noun or a name—it is only so when it becomes a symbol." The audible sound or the visible mark becomes a symbol only by human institution or convention.

Yet not all the audible sounds which men and other animals make to express their feelings or desires are, in Aristotle's opinion, to be regarded as words. "Inarticulate sounds, such as those which brutes produce, are significant, yet none of these constitutes a noun." Nor are such cries, whereby one animal calls another or communicates fear or anger, strictly conventional signs; for, as Augustine points out, they are instinctive modes of expression, and so are natural rather than conventional. They are not voluntarily instituted.

IN TERMS OF THE ancient distinction between the conventional and the natural—that which changes from time to time and place to place and that which is everywhere and always the same—no one would question the conventionality of words and of all other non-verbal symbols which are peculiar to one people, one culture, or one epoch. That words are con-

ventional signs raises the central problem concerning their meaning or significance. Utterly dissimilar words in different languages can have the same meaning, and identical sounds or marks in different languages can mean quite different things. Since the sounds or marks which constitute spoken and written words do not possess meaning naturally, from what source do such conventional signs get the meanings they have?

The usual answer, given by Aristotle, Locke, and others, is that words get their meanings from the ideas, thoughts, or feelings which men use them to express. "Spoken words," writes Aristotle, "are the symbols of mental experience and written words are the symbols of spoken words. Just as all men do not have the same writing, so all men do not have the same speech sounds, but the mental experiences, which these directly symbolize, are the same for all, as also are those things of which our experiences are the images."

In addition to being able to make articulate sounds, it was necessary for man, Locke says, to "be able to use these sounds as signs of internal conceptions, and to make them stand as marks for the ideas within his own mind, whereby they might be made known to others." Thus words came to be used by men "as the signs of their ideas; not by any natural connexion that there is between particular articulate sounds and certain ideas, for then there would be but one language amongst all men; but by a voluntary imposition, whereby such a word is made arbitrarily the mark of such an idea. The use then of words is to be sensible marks of ideas, and the ideas they stand for are their proper and immediate signification."

Locke goes further. Not only does the immediate signification of words lie in the ideas they stand for, but in his view words "can be signs of nothing else." Yet he also considers the fact that men, because they "would not be thought to talk barely of their own imaginations, but of things as they really are . . . often suppose their words to stand also for the reality of things." Locke thinks, nevertheless, that "obscurity and confusion" enter into the signification of words "whenever we make them stand for anything but those ideas we have in our own minds."

But though the meaning of a word may come from the idea it signifies, the word which is thus made meaningful seems, in the common usage of mankind, to serve as the name or designation of some real thing. It refers to something other than ideas or concepts in the human mind. Locke himself talks of "the application of names to things," and in his consideration of the distinction between proper and common names is concerned to point out that, though they differ in meaning (*i.e.*, differ in the type of idea they signify), both refer to the same sort of reality—individual existences. Aristotle and other writers who distinguish between things in the order of nature and the concepts we form of them, tend to take both views of the significance of words. Words signify the real things which they name as well as the ideas whose meanings they express. If we waive for the moment the possibility that some words may signify *only* ideas, whereas others signify both ideas and things, two questions may be asked. Are there any words which signify things alone? What is the relation between the idea and the thing a word signifies, when a word signifies them both; that is, when a word has both sorts of significance, how are they related to one another?

Aquinas answers the second question by saying that since "words are the signs of ideas, and ideas the similitudes of things, it is evident that words function in the signification of things through the conceptions of the intellect." Ideas may be the immediate or proximate object which words signify, but through them words ultimately signify the real things which are themselves the objects of ideas. According to this theory, an idea may be both the *object signified* by a word and the *medium through which* that word also signifies the thing of which we have the idea. Aquinas seems to think that ideas are always required as the medium whereby words signify things. "We can give a name to anything," he says, "only insofar as we can understand it." Accordingly, it is impossible for words to signify things directly, *i.e.*, without the mediation of ideas.

THIS POSITION HAS A number of consequences for the theory of signs and raises a number of issues. Augustine's statement that "every sign

is also a thing" has a different meaning when it is said of the sensible things which also happen to be signs and of the things of the mind—concepts or ideas—which cannot *be* without *being* signs. The understanding of this difference helps to explain the relation between verbal signs and the mental signs through which they signify or from which they get their meanings.

Whereas words are in the first instance meaningless marks and sounds which get meaning when men use them to express their thoughts or feelings, ideas and images are at once meaningful, however they arise in the mind. They are natural signs in the sense that it seems to be their very nature to signify. They do not get meaning. They do not even have meaning, in the way in which smoke as a natural sign of fire has a meaning which is distinct from, though a consequence of, its nature as smoke. An idea *is* a meaning, an intention of the mind, as it is sometimes called, a reference to an object thought about. The idea of fire is the meaning the word "fire" has when it designates the natural phenomenon which that word is conventionally used to name; and as Aristotle suggests, the conventional signs of different languages [*e.g.*, "fire" and "*feuer*"]—have the same meaning because the idea of fire is the same, and the natural phenomenon experienced and thought about is the same, for men of diverse tongues.

That ideas or mental images are themselves meanings or intentions—the symbols of things thought about—seems to be recognized in different ways by many writers in the tradition of the great books. In the *Cratylus*, Socrates suggests that signs should be like the things they signify. Some conventional signs, he thinks, are better than others in this respect. He implies that all words are inferior to mental images, which, by their very nature, imitate or resemble their objects.

The act of memory, according to Aristotle, requires a memory image which is "something like an impression or picture" of the thing remembered. If the memory image, through its resemblance to something once experienced, did not function as the sign of that absent thing, memory would not be memory, for, Aristotle argues, it would consist in beholding

the memory image itself, which is present, rather than the absent thing it stands for.

Aquinas, perhaps, is the writer most explicit in his treatment of images and ideas as in their very nature meanings or intentions of the mind. His calling them "mental words" seems to indicate that in his view they, like physical and sensible words, are signs; but the added qualification of "mental" also implies their difference. "The vocal sound which has no signification," he writes, "cannot be called a word; wherefore the exterior vocal sound is called a word from the fact that it signifies the interior concept of the mind. It follows that, first and chiefly, the interior concept of the mind is called a word." The mental word or concept suffices "when the mind turns to the actual consideration of what it knows habitually," for then, he adds, "a person speaks to himself." But unlike angels, who can make their concepts known to one another immediately, men require the medium of external speech. They must use sensible physical signs to communicate their thoughts.

Without referring to ideas as mental words, Locke does appear to identify ideas with meanings and to regard them as signs. The definition of a word, he says, is an attempt to make known "the meaning or idea it stands for." Denying that the general and the universal belong to the real existence of things, he holds that they "concern only signs, whether words or ideas. Words are general . . . when used for signs of general ideas . . . and ideas are general when they set up as the representatives of many particular things: but universality belongs not to things themselves, which are all of them particular in their existence, even those words and ideas which, in their signification, are general."

The basic issue to which Locke is addressing himself is discussed in the chapter on **UNIVERSAL AND PARTICULAR**. Locke's solution seems to involve the affirmation of abstract ideas, which are general or universal in their significance and through which common names come to have a different sort of meaning from the meaning of proper names. "Ideas become general by separating them from the circumstances of time and place, and any other ideas that may determine them to this or that particular existence." Common nouns like "man"

or "cat" become general in their significance, according to Locke, "by being made the signs of general ideas."

To the question of what kind of signification it is that general words have, Locke replies: "As it is evident, that they do not signify barely one particular thing; for then they would not be general terms, but proper names; so, on the other side, it is as evident, they do not signify a plurality; for man and men would then signify the same. . . . That, then, which general words signify," Locke declares, "is a sort of things, and each of them does that by being a sign of an abstract idea in the mind."

It seems to follow, therefore, that those who, like Hobbes and Berkeley, deny the existence of abstract ideas or universal concepts, must offer a different explanation of the meaning of common nouns or general names. "There being nothing in the world universal but names," Hobbes writes, a name is universal when it "is imposed on many things for their similitude in some quality or other accident; and whereas a proper name bringeth to mind one thing only, a universal recalls any one of those many."

On similar grounds, Berkeley criticizes Locke's theory of how words acquire general significance. His own theory is that words become general "by being made the sign, not of an abstract general idea, but of several particular ideas, any one of which it indifferently suggests to the mind." And, in another place, he says that "an idea which, considered in itself, is particular becomes general by being made to represent or stand for all other particular ideas of the same sort." He does not himself explain how we come by the notion of "the same sort," or how one particular idea can represent the sort to which other particular ideas belong. But he rejects Locke's explanation because it involves ideas which are not only general, but also abstract.

The attempt to account for the meaning of general names is, in Berkeley's view, the cause of Locke's acceptance of abstract ideas. "If there had been no such thing as speech or universal signs," he writes, "there never [would have] been any thought of abstraction." Not only do men mistakenly suppose that "every name has, or ought to have, one only precise and settled signification, which inclines [them]

to think there are certain abstract, determinate ideas that constitute the true and only immediate signification of each general name"; but they also suppose that "it is by the mediation of these abstract ideas that a general name comes to signify any particular thing. Whereas, in truth," Berkeley concludes, "there is no such thing as one precise and definite signification annexed to any general name." Where Locke would say that a common name gets its general meaning by signifying one idea which itself has general significance, Berkeley reiterates that a general name gets its meaning from "a great number of particular ideas," all of which it signifies indifferently.

THE RELATION OF WORDS to ideas raises still other problems in the theory of signs, problems which have peculiar interest in the tradition of the liberal arts. One of these problems has already been mentioned. It is the question whether some words signify ideas alone, in contrast to words which signify ideas and, through them, things. This suggests the parallel problem of words which signify words, in contrast to words which are the names of things.

In his little tract *Concerning the Teacher*, Augustine points out that some words, such as "noun" and "adjective," signify kinds of words, just as other words, such as "man" and "stone," signify kinds of things. Furthermore, in the sentence "man is a noun," the word "man" signifies itself as the object referred to; whereas in the sentence "man is an animal," the word "man" signifies a living organism of a certain sort. The same word, therefore, may signify both itself and some thing other than itself.

These differences which Augustine observes in the signification of words come to be formulated in the traditional distinction between the first and second imposition of words. A word is used in the first imposition when it is used to signify things which are not words, as, for example, the word "man" when it refers to a human being. A word is used in the second imposition when it is applied to words rather than things, as, for example, the word "noun" said of "man," or the word "man" when it is used to refer to itself in the sentence "man is a noun."

A parallel distinction is that between words

used in the first and the second intention. When the word "man" is used to signify a living organism of a certain sort, it is used in the first intention because it signifies a reality, not an idea. A word is said to be used in the second intention when it signifies an idea rather than a thing. For example, in the sentence, "man is a species," the word "species" signifies a logical classification and so is in the second intention; and the word "man" is also in the second intention because it refers to the idea which is denominated a species.

In some cases, an idea may not signify things at all, but only other ideas, such as the logical notions of *genus* and *species*. Words like "genus" and "species," unlike the words "man" and "stone," can therefore be used only in the second intention. The idea *man* is called a "first intention of the mind" because its primary function is to signify the living thing. Only secondarily does it signify itself as an object able to be considered. The idea *species*, on the other hand, is called a "second intention" because its sole function is to signify ideas which stand to other ideas in a certain relation.

Hobbes concisely summarizes most of these points when he points out that some words "are the names of the things conceived," whereas "others are the names of the imaginations themselves," that is to say, of those ideas or mental images we have of all the things we see and remember. And others again are names of names . . . as 'universal,' 'plural,' 'singular,' are the names of names." The names which we apply to particular species and genera, such as "man" and "animal," Aquinas says, "signify the common natures themselves, but not the intentions of these common natures, which are signified by the terms *genus* or *species*."

ANOTHER TRADITIONAL distinction in the modes of signification is that between intrinsic and extrinsic denomination. A name is said to be an intrinsic denomination when it is applied to a thing in order to signify its nature or its inherent properties and attributes, as, for example, when we call a thing "animal" or "rational," "white" or "square." A name is said to be an extrinsic denomination when it is applied to a thing only in order to signify some relation in which that thing stands to some-

thing else, as, for example, when we call sunshine "healthy" because it helps to produce healthy organisms or when we apply the names of animals, such as "pig" or "fox," to men because we think the men bear certain resemblances to these animals. The same word can be used in different connections both as an intrinsic and as an extrinsic denomination. "Healthy" means an inherent quality when it is applied to living organisms, and a causal relation to organic health when it is applied to sunshine; "pig" means a certain kind of animal when it is applied to the four-footed mammal, and only a resemblance to this animal in certain characteristics when it is applied to men.

This double use of the same word exemplifies what is traditionally called "equivocal speech" or the equivocal use of a name. Some writers tend to identify equivocation with ambiguity, on the ground that both involve a multiplicity of meanings for the same word. Others seem to think that a word is used ambiguously only if its user is indefinite as to which of its several meanings he intends to express; but they hold that a word can be used equivocally without ambiguity if its user makes plain that he is employing it now in this sense, now in that.

Aristotle says that two things are named equivocally "when though they have the same name, the definition corresponding with the name differs for each"; and "on the other hand, things are said to be named univocally which have both the name and the definition answering to the name in common." When we call a man and a pig an "animal," we are using that word univocally because we are using it with the same definition or meaning in both cases; but when we call a pig and a man a "pig," we are using that word equivocally because we are using it with different meanings, signifying *having the nature of a pig* in one instance and *being like a pig in certain respects* in the other.

Aristotle distinguishes several types of equivocation, of which we have already noted two. The use of the word "healthy" to describe an animal and sunshine is that type of equivocation in which the same word is used to name an inherent attribute and also a cause of that attribute; in other instances of the same type, it might be used to name the nature or attribute and the effect rather than the cause.

Speaking of a man and a pig as a "pig" represents the metaphorical type of equivocation, in which the same word is used to name the nature of a thing and something else of a different nature which has only a likeness to that nature.

Metaphors, in turn, can be divided into types. Some are based on a direct similitude between two things in some accidental respect, e.g., the man who is like a pig in manner of eating. Some, Aristotle says, are based on analogies or proportions, as, for example, when we call a king the "father of his people." Here the metaphor is based on the similarity of the relationship of a king to his subjects and of a father to his children. The name "father" is used metaphorically when it is transferred from one term in this proportion to the term which stands in an analogous position.

A third kind of metaphor, according to Aristotle, consists in the use of the same word now in a more generic, now in a more specific sense, or with broader and narrower meanings. Of this he gives an example in the *Ethics* when he discusses general and special justice, using the word "justice" narrowly to signify one of the special virtues and broadly to mean all the virtues considered in their social aspect. There is a sense of the word "justice," he writes, in which it signifies "not part of virtue but virtue entire"; "this form of justice is complete virtue, though not absolutely, but only in relation to our neighbor." The word "injustice" is also used in a correspondingly wide sense. But there is "another kind of injustice which is a part of injustice in the wide sense." This "particular injustice," Aristotle says, "shares the name and nature of the first, because its definition falls within the same genus." As Aristotle treats this type of equivocation in the *Rhetoric* and the *Poetics*, it includes three possibilities: the transfer of the name of a genus to one of its species, the transfer of the name of a species to its genus, and the transfer of the name of one species to another in the same genus.

It may be questioned whether this type of equivocation is properly classified as metaphorical, on Aristotle's own definition of metaphor as "giving a thing a name that belongs to something else." In the type of equivocation exemplified by the use of the word "justice," now

with a generic and now a specific meaning, the name does not seem to belong to the genus any more than it does to the species, or conversely. In contrast, when the name "father" is given to a king in relation to his people, the usage is metaphorical, because the name "father" belongs to something else, *i.e.*, the man who is a progenitor.

The same point can be made in terms of intrinsic and extrinsic denomination. When "justice" is used as the name for the whole of virtue (regarded socially) and also for one particular virtue, the word is an intrinsic denomination in both instances. In all other types of equivocation, the equivocal word is used once as an intrinsic and once as an extrinsic denomination; for example, as applied to the animal, the word "pig" is an intrinsic denomination, but it is an extrinsic denomination when it is applied to a man in order to signify a certain resemblance to the animal to which the name belongs. The same is true in the case of the word "healthy" as said of an animal and of sunshine.

In all these cases of equivocation, the two meanings of the same word are not totally distinct. On the contrary, the two senses have something in common. One of the meanings seems to be derived from the other; one appears to be secondary (usually the one involved in the extrinsic denomination) and the other primary. What is traditionally called "equivocation by chance," in contrast to equivocation by intention, is the extreme case in which the same word is used in two utterly distinct senses, having no common element of meaning at all; *e.g.*, the word "pen" used for a writing instrument and an enclosure for animals. Equivocation by intention, in which the different meanings of a word have something in common, thus appears to be intermediate between equivocation by chance (in which the meanings share no common element) and univocal usage (in which the meaning is exactly the same each time the word is used).

In the *Physics*, Aristotle seems to discover still another type of equivocation. "A pen, a wine, and the highest note in a scale are not commensurable," he writes. "We cannot say whether any one of them is sharper than any other . . . because it is only equivocally that the same term 'sharp' is applied to them." This

does not seem to be equivocation by chance, for the word "sharp" seems to have some common meaning as applied to the three objects which affect the diverse senses of touch, taste, and hearing; nor is it like all other cases of equivocation by intention, in that no one of these three meanings of "sharp" seems to be primary and the others derived from it. Furthermore, in all three meanings, the word "sharp" is used as an intrinsic denomination.

In the *Metaphysics*, Aristotle also considers the special pattern of meaning which words like "being" or "one" have when they are applied to such heterogeneous things as substances, quantities, qualities, etc. He refers to these words as ambiguous or equivocal, comparing them with the word "healthy" as said of an animal, and of other things which either cause health or are effects of health. It may be questioned, however, whether "being" is equivocal in the same way that "healthy" is, since it always carries the significance of an intrinsic, never of an extrinsic denomination. "Being" as said of heterogeneous things seems to be more like "sharp" said of diverse sensible qualities—having a meaning which remains somehow the same while it is diversified in each case according to the diversity of the objects to which it applies.

THESE CONSIDERATIONS of the univocal and the equivocal sign, along with the treatment of ambiguity and intrinsic and extrinsic denomination, indicate the extent and manner in which the great books anticipate the kind of analysis which in our time has come to be called "semantics." The chapter on LANGUAGE gives further evidence of the fact that many of the points and distinctions made in contemporary semantics have a long history in the tradition of the liberal arts. Furthermore, as the chapter on LANGUAGE indicates, contemporary semantics cannot even claim novelty for its great interest in freeing men from the tyranny of words or in serving as a critical instrument to cut through the "vicious abstractions" of metaphysics. Hobbes and Locke frequently dismiss theories not on the ground that they are false, but rather because they think that the statement of them consists in so many meaningless words.

In the tradition of the great books, the analysis of words and their modes of signification seems to be motivated by other interests as well as these. The distinction between the univocal and the equivocal sign, for example, is considered in its bearing on the logical problems of definition and demonstration as well as for the sake of proposing remedies to safeguard discourse against ambiguity. It is also brought to bear upon the theological problem of the meaning of the names men apply to God and on the way in which they interpret the words of Sacred Scripture.

The problem of the names of God is discussed in the chapter on SAME AND OTHER in terms of the kind of likeness which can obtain between an infinite being and finite creatures. As there appears, Aquinas takes the position that God and creatures are neither the same in any respect, nor are they in all respects so diverse as to be utterly incomparable. Though an infinite and a finite being are in his view incommensurable, yet they can also have some sort of similitude—not an unqualified sameness, but the kind of similarity which can be described as an intrinsically diversified sameness.

Aquinas holds, therefore, that no names can be applied to God and creatures univocally, for “no name belongs to God in the same sense that it belongs to creatures.” Nor, he goes on, “are names applied to God and creatures in a purely equivocal sense,” for it would follow then that “from creatures nothing at all could be known or demonstrated about God,” which supposition Aquinas denies. Between these two extremes of the simply univocal and the purely equivocal, he finds a middle ground in a type of signification which he calls “analogical.” The meaning of an analogical name, he says, “is not, as it is in univocals, one and the same; yet it is not totally diverse as in equivocals.”

What he means by “pure equivocation” seems to be what earlier writers call “equivocation by chance,” and what he means by the “analogical” seems to correspond to what they call “equivocation by intention.” “Univocal names have absolutely the same meaning,” he writes, “while equivocal names have absolutely diverse meanings; whereas in analogicals, a name taken in one signification must be placed

in the definition of the same name taken in other significations; as, for instance, “being” which is applied to *substance* is placed in the definition of “being” as applied to *accident*; and “healthy” applied to *animal* is placed in the definition of “healthy” as applied to *urine* and *medicine*.”

But, as we have seen, there are many types of equivocation by intention—the attributive, based on cause and effect, as exemplified by the word “healthy”; that involving broader and narrower meanings, exemplified by the word “justice”; metaphors, of the sort exemplified by calling a man “pig,” and of the sort based on analogies, when we speak of a king as the “father” of his people; and, finally, the very special type of equivocation found in “sharp” applied to a tone, a taste, and a touch.

If Aquinas places the kind of signification he calls “analogical” in the general area of equivocation by intention, it may be asked whether the various names of God are all analogical *in the same way*. The answer seems to be negative, for he distinguishes those names which have only a metaphorical sense when said of God, such as “angry” or “jealous”; and he denies the opinion of those who say that God is called “good” only in an attributive sense, *i.e.*, signifying him to be the cause of the goodness found in creatures. On the contrary, he thinks that words like “good” and “wise,” and especially the name “being,” are to be interpreted as intrinsic denominations when applied to both God and creatures.

For Aquinas, as for Aristotle, that would appear to make the pattern of meaning exhibited by the word “sharp” the model for the significance of “being” rather than that found in the merely attributive equivocation of the word “healthy”—whether “being” is said of substance and accidents, or of God and creatures. The point seems to be unaffected by the fact that Aquinas calls this type of signification “analogical,” whereas Aristotle always refers to “being” as equivocal. Aristotle never treats any type of equivocation as analogical except the metaphor which results from transferring the name of one term in a proportion to another term standing in the same or a similar relationship.

THE DISTINCTION BETWEEN literal and figurative or metaphorical speech seems to be of prime importance in the theologian's rules for interpreting the word of God. As indicated in the chapter on RELIGION, Augustine insists that the language of Holy Writ must be read in many senses. Aquinas distinguishes a basic literal sense from three modes of spiritual meaning. That signification "whereby words signify things belongs to the first sense, the historical or literal. That signification whereby things signified by words have themselves also a signification is called the spiritual sense, which is based on the literal and presupposes it." The spiritual sense Aquinas divides into the allegorical, the moral, and the analogical.

To grasp the various spiritual meanings, the reader must understand that in Holy Scripture "divine things are metaphorically described by means of sensible things." As in the symbolism of the sacraments, physical things serve as the outward and visible signs of an inward and spiritual grace, so also "in Holy Scripture spiritual truths are fittingly taught under the likeness of material things."

A theologian like Aquinas thus justifies metaphors not only in Scripture, but also in sacred doctrine or theology, as "both necessary and useful," whereas in his view the poet's employment of them is solely for the sake of pleasure. Philosophers and scientists, on the other hand, often take the opposite view—that metaphors have a place only in poetry and should be avoided in the exposition of knowledge.

In the writing of poetry, "the command of metaphor," says Aristotle, "is the mark of genius," but all his rules for the construction of

scientific definitions and demonstrations require the avoidance of metaphors, as of all other forms of equivocation. So, too, Hobbes inveighs against metaphors and figures of speech, giving as one of the main causes of absurdity in science "the use of metaphors, tropes, and other rhetorical figures, instead of words proper; for though it be lawful to say (for example) in common speech, *the way goeth, or leadeth hither or thither, the Proverb says this or that* (whereas ways cannot go, nor Proverbs speak); yet in reckoning, and seeking of truth, such speeches are not to be admitted."

Darwin looks forward to the day when "the terms used by naturalists, of affinity, relationship, community of type, paternity, morphology, adaptive characters, rudimentary and aborted organs, and so forth, will cease to be metaphorical and will have a plain significance." Freud, on the other hand, aware of how pervasive symbolism is in all the works of man, normal and neurotic, dreaming and awake, seems to be reconciled to the inevitability of metaphors in scientific discourse. The difficulty we meet with in picturing certain psychological processes, he writes, "comes from our being obliged to operate with scientific terms, *i.e.*, with the metaphorical expressions peculiar to psychology. . . . Otherwise we should not be able to describe the corresponding processes at all, nor in fact even to have remarked them. The shortcomings of our description would disappear if for the psychological terms we could substitute physiological or chemical ones. These, too, only constitute a metaphorical language, but one familiar to us for a much longer time and perhaps also simpler."

OUTLINE OF TOPICS

The theory of signs

- 1a. The distinction between natural and conventional signs
- 1b. The intentions of the mind: ideas and images as natural signs
- 1c. The things of nature functioning symbolically: the book of nature
- 1d. The conventional notations of human language: man's need for words
- 1e. The invention of non-verbal symbols: money, titles, seals, ceremonies, courtesies
- 1f. Natural signs as the source of meaning in conventional signs: thought as the medium through which words signify things

PAGE

740

741

742

2. The modes of signification

- 2a. The first and second imposition of words: names signifying things and names signifying names
- 2b. The first and second intention of names: words signifying things and words signifying ideas
- 2c. Intrinsic and extrinsic denominations: the naming of things according to their natures or by reference to their relations
- 2d. Proper and common names
- 2e. Abstract and concrete names

743

3. The patterns of meaning in human discourse

- 3a. Verbal ambiguity: indefiniteness or multiplicity of meaning
- 3b. The distinction between univocal and equivocal speech
- 3c. The types of equivocation
 - (1) The same word used literally and figuratively: metaphors derived from analogies or proportions and from other kinds of similitude
 - (2) The same word used with varying degrees of generality and specificity: the broad and narrow meaning of a word
 - (3) The same word used to signify an attribute and its cause or effect
- 3d. The significance of names predicated of heterogeneous things: the analogical as intermediate between the univocal and the equivocal

744

745

4. The determination of meaning in science and philosophy

- 4a. The relation between univocal meaning and definition
- 4b. The dependence of demonstration on univocal terms: formal fallacies due to equivocation
- 4c. The nature and utility of semantic analysis: the rectification of ambiguity; the clarification and precision of meanings
- 4d. The use of metaphors and myths in science and philosophy
- 4e. The use of signs in reasoning: necessary and probable signs; the interpretation of symptoms in medicine

746

5. Symbolism in theology and religion

- 5a. Natural things as signs of divinity
- 5b. Supernatural signs: omens, portents, visitations, dreams, miracles
- 5c. The symbolism of the sacraments and of sacramental or ritualistic acts
- 5d. The symbolism of numbers in theology
- 5e. The interpretation of the word of God
- 5f. The names of God: the use of words to signify the divine nature

747

748

749

6. Symbolism in psychological analysis

- 6a. The symbolism of dreams: their latent and manifest content
- 6b. The symbolism of apparently normal acts: forgetting, verbal slips, errors
- 6c. The symbolism of anxieties, obsessions, and other neurotic manifestations

750

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The theory of signs

1a. The distinction between natural and conventional signs

OLD TESTAMENT: *Genesis*, 2:10-20; 11:1-9

Chapter 86: SIN

INTRODUCTION

THE sin of Satan and the sin of Adam are among the great mysteries of the Christian religion. Satan is highest among the angels, the first of God's spiritual creatures. He is only less than God in the perfection of his nature. Adam is created with supernatural graces and gifts, his immortal body is completely responsive to his spirit, his appetite in all things is submissive to his reason, and his reason is turned toward God, according to the original justice which harmonized his faculties and the elements of his nature.

The only evil latent in either Satan or Adam would seem to reside in the privation of infinite being, power, and knowledge. But this is not a moral evil in them; it is neither a sin nor a predisposition to sin. Hence the only cause of their sinning, if God himself does not predestine them to sin, must be a free choice on their part between good and evil. If God positively predestines them to sin, then they would seem to be without responsibility, and so without sin. If they are not predetermined to evil—if, except for the weakness of being finite, they are without positive blemish—how does the conflict arise in them which opens the choice between good and evil and impels them, almost against the inclination of their natures, away from good and toward evil?

In Milton's *Paradise Lost*, God says of Adam: "I made him just and right, sufficient to have stood, though free to fall." Of Satan and fallen angels, as well as of Adam, God observes:

They therefore as to right belongd,
So were created, nor can justly accuse
Thir maker, or thir making, or thir Fate;
As if Predestination over rul'd
Their will, dispos'd by absolute Decree
Of high foreknowledge; they themselves decreed
Thir own revolt, not I: if I foreknew,
Foreknowledge had no influence on their fault,
Which had no less prov'd certain unforeknown.

Yet there is a difference between Adam and Satan. The fallen angels "by their own suggestion fell, self-tempted, deprav'd." Satan, having sinned, becomes man's tempter. "Man falls deceiv'd by the other first: Man therefore shall find grace, the other none."

As Satan approaches the Garden of Eden to work his will on man, he contemplates his plight. He does not deny his sin, he does not repent it, he does not seem fully to understand it. Thus Milton has him speak:

O thou that with surpassing Glory crowned,
Look'st from the sole Dominion like the God
Of this new World; at whose sight all the Starrs
Hide thir diminisht heads; to thee I call,
But with no friendly voice, and add thy name
O Sun, to tell thee how I hate thy beams
That bring to my remembrance from what state
I fell, how glorious once above thy Spheare;
Till Pride and worse Ambition threw me down
Warring in Heav'n against Heav'n's matchless King;
Ah wherefore! he deserved no such return
From me, whom he created what I was
In that bright eminence, and with his good
Upbraided none; nor was his service hard.
What could be less than to afford him praise,
The easiest recompense, and pay him thanks,
How due! yet all his good prov'd ill in me,
And wrought but malice; lifted up so high
I sleind subjection, and thought one step higher
Would set me highest, and in a moment quit
The debt immense of endless gratitude,
So burthensome, still paying, still to owe . . .
O had his powerful Destiny ordained
Me some inferior Angel, I had stood
Then happy; no unbounded hope had rais'd
Ambition. Yet why not? some other Power
As great might have aspir'd, and me through mean
Drawn to his part; but other Powers as great
Fell not, but stand unshak'n, from within
Or from without, to all temptations arm'd.
Hads't thou the same free Will and Power to stand?
Thou hadst't: whom has thou then or what to accuse,
But Heav'n's free Love, dealt equally to all?
Be then his Love accurst, since love or hate
To me alike, it deals eternal woe.
Nay cursed be thou; since against his, thy will

Chose freely what it now so justly rue,
 Me miserable! which way shall I flie
 Infinite wrauth, and infinite despaire?
 Which way I flie is Hell; my self am Hell;
 And in the lowest deep a lower deep
 Still threatning to devour me opens wide,
 To which the Hell I suffer seems a Heav'n.
 O then at last relent: is there no place
 Left for Repentance, nor for Pardon left?
 None left but by submission; and that word
Disdain forbids me, and my dread of shame
 Among the spirits beneath, whom I seduc'd
 With other promises and other vaunts
 Then to submit, boasting I could subdue
 Th' Omnipotent.

Before Satan approaches Eve, Adam reminds her of their debt of obedience, saying that God requires

From us no other service than to keep
 This one, this easie charge, of all the Trees
 In Paradise that beare delicious fruit
 So various, not to taste that onely Tree
 Of Knowledge, planted by the Tree of Life.
 So neer grows Death to Life, what ere Death is,
 Some dreadful thing no doubt; for well thou knowst
 God hath pronounc'd it death to taste that Tree,
 The only sign of our obedience left
 Among so many signes of power and rule
 Conferd upon us, and Dominion giv'n
 Over all other Creatures that possesse
 Earth, Aire, and Sea. Then let us not think hard
 One easie prohibition, who enjoy
 Free leave so large to all things else, and choice
 Unlimited of manifold delights.

The temptation to disobey first moves Eve in a dream in which the apparition of an angel speaks of the forbidden fruit

..... as onely fit
 For Gods, yet able to make Gods of Men;
 And why not Gods of Men, since good, the more
 Communicated, more abundant grows,
 The Author not impar'd, but honour'd more?

"Here, happie Creature," the vision says to her,

Happier thou mayst be, worthier canst not be:
 Taste this, and be henceforth among the Gods
 Thy self a Goddess, not to Earth confin'd,
 But sometimes in the Air, as wee, sometimes
 Ascend to Heav'n, by merit thine, and see
 What life the Gods live there, and such live thou.

Later when Satan in the guise of the Serpent actually addresses Eve, he argues in the same vein, that as he, by tasting of this fruit, speaks as a man, so Eve and Adam, if they too partake, "shall be as Gods, knowing both Good

and Evil as they know." Eve succumbs and, as Milton tells the story, Adam, knowing fully the evil of his act, joins Eve in disobedience, not from envy of the gods, but out of love for her, willing to die because unwilling to live without her.

Willing "to incurr divine displeasure for her sake, or Death. . . .

..... he scrupl'd not to eat
 Against his better knowledge, not deceav'd,
 But fondly overcome with Femal charm.
 Earth trembled from her entrails, as again
 In pangs, and Nature gave a second groan,
 Skie lowr'd, and muttering Thunder, som sad
 drops
 Wept at compleating of the mortal Sin
 Original.

IN THE POET'S expansion of the third chapter of Genesis, the basic elements in the Judaeo-Christian conception of sin seem to be plainly accented: the pride and envy which move Satan and Eve, the disobedience which results from the disorder of Adam's loving Eve more than he loves God. In the *Divine Comedy*, another great poem of sin and salvation, Adam speaks to Dante in Paradise and tells him that "the tasting of the tree was not by itself the cause of so great an exile, but only the overpassing of the bound." Earlier Beatrice explains why, in order to redeem man from sin, the Word of God assumed human nature—"the nature which has estranged itself from its Maker." She tells Dante that "this nature, thus united with its Maker, was pure and good such as it was created; but by itself it had been banished from Paradise, because it turned aside from the way of truth and from its own life." Man can fall from his nobility by "sin alone . . . which disfranchises him, and makes him unlike the Supreme Good, so that he is little illumined by Its light; and to his dignity he never returns, unless where fault empties, he fills up with just penalties against evil delight."

In both the pagan and the Christian conceptions of sin, man's pride and his disobedience of divine commandment are usually connected with the very notion of sin. The heroes of the Greek tragedies, exhibiting the tragic fault of pride, seem to forget that, though they strive with gods, they are only men, subject to laws they cannot disobey without catastrophe. In

the *Iliad*, Phoenix cautions Achilles to "battle with your pride and beat it; cherish not your anger for ever; the might and majesty of heaven are more than ours, but even heaven may be appeased; and if a man has sinned he prays the gods, and reconciles them to himself by his piteous cries."

In pride and disobedience we find the deep disorder of love which lies at the heart of sin. Pride is self-love in excess of what the self deserves. Disobedience, as in the case of Milton's Adam, may be prompted by a love which, too, exceeds the worth of the object loved. The measure of that worth, or the bounds put upon the love of self or other, is set by the Supreme Good which, ordering all other goods, should also order our loves in proportion to their goodness.

This seems to be the central insight of the *Divine Comedy*. It is given a summary statement in Purgatory, where Virgil explains how love is the root both of virtue and of sin. "Neither Creator *nor* creature," he says to Dante, "was ever without love, either natural or of the mind, and this thou knowest. The natural is always without error; but the other may err either through an evil object, or through little or too much vigor. While love is directed on the primal goods, and with due measure on the secondary, it cannot be the cause of ill delight. But when it is bent to evil, or runs to good with more zeal, or with less, than it ought, against the Creator his own creature is working. Hence thou canst comprehend that love is of necessity the seed in you of every virtue, and of every action that deserves punishment."

Dostoevsky offers us further thoughts concerning the relation of love and sin. In the *Brothers Karamazov*, Father Zossima makes lack of love the punishment as well as the substance of sin. To those who ask, "What is Hell?" Father Zossima replies: "I maintain that it is the suffering of being unable to love. . . . They talk of hell fire in the material sense. I don't go into that mystery and I shun it. But I think if there were fire in the material sense, they would be glad of it, for, I imagine, that in material agony, their still greater spiritual agony would be forgotten for a moment. . . . Oh, there are some who remain proud and fierce even in hell, in spite of their certain knowledge and con-

templation of the absolute truth; there are some fearful ones who have given themselves over to Satan and his proud spirit entirely. For such, hell is voluntary and ever consuming; they are tortured by their own choice. For they have cursed themselves, cursing God and life."

To avoid sin, the only positive commandment, according to Father Zossima, is to love in accordance with God's love. "Love a man even in his sin," he counsels, "for that is the semblance of Divine Love and is the highest love on earth. . . . And let not the sin of men confound you in your doings. Fear not that it will wear away your work and hinder its being accomplished. There is only one means of salvation; then take unto yourself, and make yourself responsible for, all men's sins; that is the truth, you know, friends, for as soon as you sincerely make yourself responsible for everything and for all men, you will see at once that it is really so, and you are to blame for everyone and for all things. But throwing your own indolence and impotence on others, you will end by sharing the pride of Satan and murmuring against God. Of the pride of Satan, what I think is this: it is hard for us on earth to comprehend it, and therefore it is so easy to fall into error and to share it, even imagining that we are doing something grand and fine."

In the disorder of love which leads to sin, sin is itself enjoyed for its own sake, and the disobedient act is pleasant because it is forbidden. In that also there is the pride of supposing one's self to be a law unto one's self. In his *Confessions*, concerned most immediately with his own sinfulness, Augustine reflects upon the pears he stole in his youth, not, as he says, from "any desire to enjoy the things I stole, but only the stealing of them and the sin." He asks himself: "What was it then that in my wretched folly I loved in you, O theft of mine, deed wrought in that dark night when I was sixteen?" He had no need of the pears. "Once I had gathered them," he says, "I threw them away, tasting only my own sin and savouring that with delight; for if I took so much as a bite of any one of those pears, it was the sin that sweetened it."

He keeps on asking himself what it was that attracted him in that theft, what it was that

he enjoyed in that childish act of stealing. "Perhaps," he finally answers, "it was the thrill of acting against Your law—at least in appearance, since I had no power to do so in fact, the delight a prisoner might have in making some small gesture of liberty—getting a deceptive sense of omnipotence from doing something forbidden without immediate punishment. I was that slave, who fled from his Lord and pursued his Lord's shadow. O rottenness, O monstrousness of life and abyss of death! Could you find pleasure only in what was forbidden, and only because it was forbidden?"

IN THE PAGAN AND Judæo-Christian conceptions of sin, the fundamental meaning seems to depend upon the relation of man to the gods or to God, whether that itself be considered in terms of law or love. The vicious act may be conceived as one which is contrary to nature or reason. The criminal act may be conceived as a violation of the law of man, injurious to the welfare of the state or to its members. Both may involve the notions of responsibility and fault. Both may involve evil and wrongdoing. But unless the act transgresses the law of God, it is not sinful. The divine law which is transgressed may be the natural law that God instills in human reason, but the act is sinful if the person who commits the act turns away from God to the worship or love of other things.

To disbelieve in God, in 'divine law and divine punishment, is also to disbelieve in sin—at least in the sense in which religious men have distinguished between saints and sinners, between the righteous and the wicked in the eyes of God. "There are only two kinds of men," writes Pascal: "the righteous who believe themselves sinners; the rest, sinners, who believe themselves righteous."

Those who reject the religious meaning of sin do not deny the wide prevalence of a sense of sin, nor do they deny that many men suffer remorse for transgression^s which they suppose to be evil in God's eyes; but, with Freud, they interpret these feelings of guilt in terms of natural causes. They hold that the person who is tormented by conscience suffers from an illusion concerning the true nature of his guilt. When the sense of sin is intensely active and is, in addition, apparently unexplained by the

character and conduct of the person, the guilt-feelings, according to the Freudian view, take on the attributes of pathological distortion and become part of the symptomology of the neuroses. There is no question about the sincerity of the person who is thus agonized, but only about the true causes of the agony.

"When one asks how a sense of guilt arises in anyone," Freud says, "one is told something one cannot dispute: people feel guilty (pious people call it 'sinful') when they have done something they know to be 'bad.' But then one sees how little this answer tells one." What accounts for the judgment a man makes of himself as good or bad? Freud's answer is that "what is bad is, to begin with, whatever causes one to be threatened with a loss of love; because of the dread of this loss, one must desist from it. That is why it makes little difference whether one has already committed the bad deed or only intends to do so."

The external authority of the father and, through him, of society becomes, according to Freud, "internalized by the development of a super-ego. The manifestations of conscience are then raised to a new level; to be strict one should not call them conscience and sense of guilt before this. . . . At this second stage of development, conscience exhibits a peculiarity which was absent in the first. . . . That is, the more righteous a man is, the stricter and more suspicious will his conscience be, so that ultimately it is precisely those people who have carried holiness farthest who reproach themselves with the deepest sinfulness. . . . A relatively strict and vigilant conscience is the very sign of a virtuous man, and though saints may proclaim themselves sinners, they are not so wrong, in view of the temptations of instinctual gratifications to which they are peculiarly liable—since, as we know, temptations do but increase under constant privation, whereas they subside, at any rate, temporarily, if they are sometimes gratified."

Freud applies his theory of the origin of feelings of guilt (in "the dread of authority" first and later in "the dread of the super-ego,") to the religious sense of sin. "The people of Israel," he writes, "believed themselves to be God's favorite child, and when the great Father hurled visitation after visitation upon

them, it still never shook them in this belief or caused them to doubt His power and His justice; they proceeded instead to bring their prophets into the world to declare their sinfulness to them, and out of their sense of guilt they constructed the stringent commandments of their priestly religion."

In general, Freud thinks, the great religions "have never overlooked the part played by the sense of guilt in civilization. What is more, they come forward with a claim . . . to save mankind from this sense of guilt which they call sin. We have drawn our conclusion from the way in which in Christianity this salvation is won—the sacrificial death of one who therewith takes the whole of the common guilt of all upon himself, about the occasion on which this primal sense of guilt was first acquired." The conclusion referred to is developed in two of Freud's works which are devoted to the consideration of religion and sin—the *Future of an Illusion* and *Totem and Taboo*. In the latter of these books, Freud tells us, he had first "expressed a suspicion that perhaps the sense of guilt in mankind as a whole, which is the ultimate source of religion and morality, was acquired in the beginning of history through the Oedipus complex."

OTHER WRITERS, who approach the problem of sin in legalistic rather than psychological terms, either make no distinction between crime and sin or make the distinction without referring to God. Spinoza, for example, prefaces his explanation of the meanings of "praise and blame, merit and crime," with a discussion of the difference between "the natural and civil state of man." In a state of nature, he says, no one is "bound by any law to obey any one but himself. Hence in a natural state sin cannot be conceived, but only in a civil state, where it is decided by universal consent what is good and what is evil, and where everyone is bound to obey the State. Sin, therefore, is nothing but disobedience, which is punished by the law of the State alone."

Though Hobbes does not identify crime and sin, his distinction between them does not seem to be based on the contrast between the civil law and the divine law, unless the latter is equated with the law of nature. "A crime is a

sin," he writes, "consisting in the committing (by deed or word) of that which the law forbiddeth, or the omission of that which it hath commanded. So that every crime is a sin, but not every sin a crime. To intend to steal or kill is a sin, though it never appear in word or fact, for God that seeth the thoughts of man, can lay it to his charge; but till it appear by something done, or said, by which the intention may be argued by a human judge, it hath not the name of crime."

"From this relation of sin to the law," Hobbes continues, "and of crime to the civil law, may be inferred, first, that where law ceaseth, sin ceaseth. But because the law of nature is eternal, violation of covenants, ingratitude, arrogance, and all facts contrary to any moral virtue, can never cease to be sin. Secondly, that the civil law ceasing, crimes cease; for there being no other law remaining, but that of nature, there is no place for accusation; every man being his own judge, and accused only by his own conscience, and cleared by the uprightness of his own intention. When therefore his intention is right, his fact is no sin; if otherwise, his fact is sin, but not crime."

The more strictly religious conception of sin seems to be exemplified by Pascal's remark that "all that God does not permit is forbidden" and that "sins are forbidden by the general declaration that God has made, that He did not allow them." Whatever God does not permit, "we ought to regard as sin," for "the absence of God's will, which is all goodness and all justice, renders it unjust and wrong."

With the precision of a theologian in these matters, Aquinas defines the peculiar type of evil which is sin. "Evil," he writes, "is more comprehensive than sin, as also is good than right. . . . Now in those things that are done by the will, the proximate rule is the human reason, while the supreme rule is the eternal law. When, therefore, a human act tends to the end according to the order of reason and of the eternal law, then that act is right; but when it turns aside from that rectitude, then it is said to be a sin." Elsewhere he says that "every created will has rectitude of act only so far as it is regulated according to the divine will. . . . Thus only in the divine will can there be no sin,

whereas in the will of every creature, considered according to its nature, there can be sin."

THE THEOLOGICAL DISCUSSION of sin involves a tremendous range of topics, and problems as significant as they are subtle. The dogma of original sin, for example, raises questions not only about the cause and character of Adam's transgression, but also about the punishment which is visited upon the children of Adam in perpetuity, and about the conditions under which man can be reclaimed from his bondage to sin, both original and actual or personal.

There seems to be some resemblance between the Christian doctrine that Adam's sin merits a penalty to be paid by all subsequent generations, and the Jewish doctrine of the collective responsibility of the people of Israel for the sins of their ancestors, even unto the third and fourth generation. But the points of difference appear to be more fundamental than the similarity.

In the first place, the sins of the fathers from which later generations suffer are the individual sins of men whose natures are predisposed to sin, as Adam's, before the fall, was not. In the second place, the punishment is visited not upon the whole human race, but only upon the Chosen People, and in the form of temporal scourges rather than in a corruption of human nature itself.

Furthermore, the Hebrew prophet Ezekiel questions the justice of collective responsibility. "What mean ye," he asks,

that ye use this proverb concerning the land of Israel, saying, The fathers have eaten sour grapes, and the children's teeth are set on edge?

As I live, saith the Lord God, ye shall not have occasion any more to use this proverb in Israel. . . .

The soul that sinneth, it shall die. The son shall not bear the iniquity of the father, neither shall the father bear the iniquity of the son: the righteousness of the righteous shall be upon him, and the wickedness of the wicked shall be upon him.

But if the wicked will turn from all his sins that he hath committed, and keep all my statutes, and do that which is lawful and right, he shall surely live, he shall not die.

All his transgressions that he hath committed, they shall not be mentioned unto him: in his righteousness that he hath done he shall live.

Have I any pleasure at all that the wicked should die? saith the Lord God: and not that he should return from his ways, and live?

But when the righteous turneth away from his righteousness, and committeth iniquity, and doeth according to all the abominations that the wicked man doeth, shall he live? All his righteousness that he hath done shall not be mentioned: in his trespass that he hath trespassed, and in his sin that he hath sinned, in them shall he die.

According to Christian teaching, the justice of individual punishment for the sins which individuals commit in their own lifetime does not apply to the penalty which all men must pay for the sin of Adam. "Wherefore, as by one man sin entered into the world," St. Paul writes to the Romans,

and death by sin; and so death passed upon all men, for that all have sinned:

(For until the law sin was in the world: but sin is not imputed when there is no law.

Nevertheless, death reigned from Adam to Moses, even over them that had not sinned after the similitude of Adam's transgression, who is the figure of him that was to come.

But not as the offence, so also is the free gift. For if through the offence of one many be dead, much more the grace of God, and the gift by grace, which is by one man, Jesus Christ, hath abounded unto many.

And not as it was by one that sinned, so is the gift: for the judgment was by one to condemnation, but the free gift is of many offences unto justification.

For if by one man's offence death reigned by one; much more they which receive abundance of grace and of the gift of righteousness shall reign in life by one, Jesus Christ.)

Therefore as by the offence of one judgment came upon all men to condemnation; even so by the righteousness of one the free gift came upon all men unto justification of life.

For as by one man's disobedience many were made sinners, so by the obedience of one shall many be made righteous.

The Christian doctrine of original sin thus appears to be closely connected with the Christian doctrine of the need for a divine saviour—God Himself become man to redeem man from the taint of sin, and through the sacraments He instituted to provide the instruments of healing grace and the means of repentance for, and absolution from, both original sin and the individual's own personal sins.

The understanding of the sacraments; the theory of grace in relation to the original and fallen nature of man; the issue concerning grace and good works, or God's justification and man's merit, in the achievement of sanctity and salvation; the distinction between the everlasting perdition of Hell and the expiatory punishments of Purgatory—all these fundamental theological problems are involved in the consideration of sin and its consequences, both temporal and eternal.

Some of these problems are discussed in the chapters on MAN, ANGEL, IMMORTALITY, and PUNISHMENT. Other matters, such as the classification of sins according to the distinction between spiritual and carnal, mortal and venial, and the enumeration of the various species of both mortal and venial sin in the order of their gravity, are problems of moral theology. Though they belong primarily to this chapter, they are also related to the classification of virtues and vices, especially to the theory of the theological virtues; and among the theological virtues, especially to charity, which is the principle of sanctity, even as pride is the principle of sin.

Of all points in the consideration of sin, the distinction between original and acquired sin is perhaps the most important, not only because inherited sinfulness is conceived as the predisposing cause of all other sins, but also because the human nature corrupted by sin is conceived as fallen below the perfection of a purely natural man as well as below the state of grace in which Adam was created. As Adam had gifts which made him superior to the natural man—immortality, infused knowledge and freedom from error, immunity from concupiscence, exemption from labor and servility—so the children of Adam, cast out of Eden, have ingrained weaknesses which make them unable to achieve the goods or attain the ends proportionate to their human nature.

According to some theologians, the purely natural man, without either the gifts of grace or the wounds of sin, has never existed. It is this mystery of man, having natural aspirations which exceed the weakened powers of his fallen nature, that Pascal seems to contemplate in all his observations on "the greatness and wretchedness of man"—the "astonishing contradic-

tions" which he thinks only the Christian religion explains. In the state in which men now are, he writes, "there remains to them some feeble instinct of the happiness of their former state; and they are plunged in the evils of their blindness and their lust, which have become their second nature."

"As the result of original justice," Aquinas writes, "the reason had perfect hold over the lower parts of the soul, while reason itself was perfected by God in being subject to Him. Now this same original justice was forfeited by the sin of our first parent . . . so that all the powers of the soul are left, as it were, destitute of their proper order, whereby they are naturally directed to virtue. This destitution is called a wounding of nature. . . . In so far as the reason is deprived of its order to the true, there is the wound of ignorance; in so far as the will is deprived of its order to the good, there is the wound of malice; in so far as the irascible is deprived of its order to the arduous, there is the wound of weakness; and in so far as the concupiscible is deprived of its order to the delectable as moderated by reason, there is the wound of concupiscence. Accordingly, these are the four wounds inflicted on the whole of human nature as a result of our first parent's sin."

Aquinas rejects the supposition that "the entire good of human nature can be destroyed by sin," arguing that what sin diminishes is "the natural inclination to virtue, which is befitting to man from the very fact that he is a rational being." But "sin cannot entirely take away from man the fact that he is a rational being, for then he would no longer be capable of sin."

Other theologians take a more extreme view than Aquinas and Augustine. They attribute depravity rather than weakness to human nature as a consequence of original sin. "On the Calvinistic theory," Mill writes, "the one great offense of man is self-will." Under the maxim that "whatever is not a duty, is a sin," men are left with no choice. "Human nature being radically corrupt," Mill continues, "there is no redemption for any one until human nature is killed within him." But, according to Augustine and Aquinas, original sin does not deprive the individual man entirely of the power to estab-

lish his worth, though it puts him in need of God's help to be worthy of salvation. Between the one extreme which holds that men can be saved by God's grace alone, and the other extreme which supposes that men can win salva-

tion by the merit of their own good works, Augustine and Aquinas try to take the middle position, according to which neither grace without good works nor good works without grace will avail.

OUTLINE OF TOPICS

	PAGE
1. The nature of sin: violation of divine law; disorder in man's relation to God	761
2. The kinds and degrees of sin	762
2a. The distinction between original and actual sin	
2b. The distinction between spiritual and carnal sin	
2c. The distinction between mortal and venial sin	
(1) The classification and order of mortal sins	
(2) The classification and order of venial sins	
3. The doctrine of original sin	763
3a. The condition of Adam before sin: his supernatural state of grace; his preternatural gifts	
3b. The sin of Adam	
3c. The nature of fallen man in consequence of Adam's sin	764
3d. The need for a mediator between God and man to atone for original sin	
3e. The remission of sin: baptism; the state of the unbaptized	765
4. Actual or personal sin	
4a. The relation of original sin to actual sin	
4b. The causes and occasions of actual sin	
4c. Pride as the principle of sin: the tragic fault of <i>hybris</i>	766
4d. The consequences of actual sin: the loss of charity and grace	
4e. The prevention and purging of sin: purification by sacrifice; the sacrament of penance; contrition, confession, and absolution	
5. The remorse of conscience and feelings of guilt: the psychogenesis and pathological expression of the sense of sin	767
6. Guilt and the punishment of sin	768
6a. Man's freedom in relation to responsibility and guilt for sin: divine predestination or election	
6b. Collective responsibility for sin: the sins of the fathers	769
6c. The temporal punishment of sin: divine scourges	
6d. The eternal punishment of sin: the everlasting perdition of the unrepentant in Hell	770
6e. The purifying punishments of Purgatory	771
7. Grace and good works in relation to salvation from sin	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SLCT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45--(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The nature of sin: violation of divine law; disorder in man's relation to God

OLD TESTAMENT: *Genesis*, 2:15-17; 3 esp 3:11; 4:7; 6:11-13 / *Exodus*, 20:1-17 / *Deuteronomy*, 5:6-21 / *Joh*, 35:6 / *Psalms*, 36:1-4--(D) *Psalms*, 35:1-5 / *Isaiah*, 59:2--(D) *Isaiah*, 59:2

NEW TESTAMENT: *Matthew*, 4:1-11 / *Luke*, 4:1-13 / *John*, 8:34; 9:31; 15:22 / *Romans*, 5:13, 19-21; 6:7-14, 23; 7:7-11; 14:23 / *I Corinthians*, 15:55-56 / *James*, 1:15; 4:17 / *I John*, 3:4-8; 5:17

Chapter 87: SLAVERY

INTRODUCTION

MORALISTS and political philosophers who appear to be in substantial agreement on the principles of justice differ remarkably from one another on whether slavery is just. The sharpness of this disagreement is made all the more remarkable by the almost unanimous condemnation of slavery—in two senses of that term.

As appears in the chapter on TYRANNY, the condition of those who live under tyrannical rule is generally conceived as a kind of slavery, involving not only the loss of political freedom but also the suffering of other abuses or injuries. With the possible exception of Hobbes, who says that tyranny is merely monarchy “misliked,” none of the great authors from Plato and Aristotle to Rousseau, Hegel, and Mill, writes of tyranny except as a perversion of government—unjust, lawless, or illegitimate. The evil of tyranny for them lies in the enslavement of men who deserve to be free, who should govern themselves or at least should be governed for their own good, not exploited by a ruler who uses them for his own private interests.

Some writers, like Montesquieu, who tend to identify despotism and tyranny see little difference between subjection and slavery, regarding both alike as degradations. Yet Montesquieu—and with him Aristotle—also thinks that for certain races of mankind subjection or slavery may be justified. Mill later makes the comparable point that for a people at a certain stage of political development, subjection may be necessary for a time in preparation for citizenship. The two basic distinctions in political status which are here implied—between slavery and subjection and between subjection and citizenship—are developed more fully in the chapter on CITIZEN. The first of these distinctions relates to the difference in

the condition of men under tyranny and under benevolent despotism; the second, to the difference in the condition of men under absolute and under constitutional government.

The other sense in which the word “slavery” seems always to be used with the connotation of evil is the sense in which Augustine speaks of man’s slavery to lust as a consequence of original sin; or in which Spinoza writes of human bondage—the condition of men enslaved by the tyranny of their passions—as compared with human freedom under the rule of reason. This meaning of slavery is discussed in other chapters, such as EMOTION and LIBERTY.

The slavery which results from the tyranny of the passions is a disorder from which any man may suffer; it stems from a weakness in the human nature which is common to all. Similarly, the slavery of a whole people under tyrannical rule is a perversion of government for all the members of the community, not just for some. But whenever slavery is defended, it is justified only for *some men* within a community, not for all; or if for a whole people, not for all mankind, but only for *certain peoples* under certain conditions. With regard to slavery, the basic issue of justice is, therefore, whether *some men* should be slaves or *all* should be free, not whether *all* should be slaves or *all* free.

THE DISTINCTION BETWEEN the slavery of some men within a community and the enslavement of a whole people appears to be related to the distinction between economic and political enslavement. In the ancient meaning of the word “economic,” the economic slave is the slave of the household or family. “A complete household,” writes Aristotle, “consists of slaves and freemen.” The elements of a family are

"master and slave, husband and wife, father and children."

That the distinction between slave and free man signifies economic rather than political status for Aristotle, and for the ancients generally, seems to be indicated by the fact that, under certain types of oligarchical constitution, free men are excluded from citizenship without thereby becoming slaves. But in all ancient republics, democratic as well as oligarchical, slaves are ineligible for citizenship.

Though the relation of master and slave is essentially economic rather than political, such slavery has a political aspect in the sense that some men have no function in the state except to serve other men. Aristotle speaks of them as necessary to the state, but not, as are citizens, parts of it. "The necessary people," he says, "are either slaves who minister to the wants of individuals, or mechanics and laborers who are the servants of the community."

The mark of economic slavery seems to be the kind of work a man does and the conditions under which he labors, whereas political slavery seems to depend upon the kind of life a man leads and the conditions under which he lives in society. The economic slave serves a master by his work. The political slave lives under a tyrant. In Aristotle's view it is only the man who is economically free who has anything to lose from being enslaved by a tyrant. "No free man, if he can escape from it, will endure such government," he writes; but the barbarians, who "are by nature slaves," do not rebel against tyranny. Where some men are by nature free, there is also a natural distinction between women and slaves, "but among barbarians," according to Aristotle, "no distinction is made between women and slaves, because there is no natural ruler among them: they are a community of slaves, male and female."

The difference between economic bondage—which can include what Marx calls the wage slavery of the proletariat, as well as chattel slavery and other forms of serfdom—and the political condition of those enslaved by a tyrant does not seem to affect the issue of justice. Those, like Hobbes and Locke, who think that the vanquished in war must pay for being allowed to live by submitting to slavery, do not seem concerned whether the servitude takes

the form of private possession by an individual master or the subjugation of a whole people by the conquering state. Nor do those, like Aristotle and Montesquieu, who regard some men or some races as naturally servile, seem to offer reasons for political slavery different from those which they think justify economic servitude.

What does seem to affect the issue concerning the justice of slavery is the difference between the natural slave and the slave by force or law. This is the difference between the man who is born a slave (not merely born of slaves and into slavery) and the man who, born with a nature fit for freedom, is made a slave, either because his parents before him were slaves, because he is sold into slavery, or because, for one reason or another, he forfeits his birthright to freedom.

If no men are by nature slaves, then the only questions of justice concern the conditions which justify making slaves of free men. These may remain the only questions even if there are natural slaves, since it cannot be unjust to treat as slaves those who are by nature slaves, any more than it is unjust to treat animals as brutes.

In both cases some consideration may be given to how slaves or animals should be treated. "The right treatment of slaves," Plato declares in the *Laws*, "is to behave properly to them, and to do to them, if possible, even more justice than to those who are our equals." Justice also requires, according to Plato, that if a slave or an animal do any harm, the master shall pay for the injury.

WE HAVE ALREADY observed that, with regard to natural slavery, the main issue is one of fact. The fact in question concerns human equality and inequality. Within that equality of all men which rests upon their common possession of human nature, are some men by nature inferior to others in their use of reason or their capacity for leading the life of reason? Does such inferiority prevent them from directing their own lives or even their own work to the ends which are the natural fulfillment of man's powers? And if so, do not such men profit from being directed by their superiors, as well as from serving them and, through serving them,

participating in the greater good their betters are able to achieve?

These are the questions of fact which Aristotle seems to answer affirmatively as he develops his theory of natural slavery. If the facts are granted, then no issue of justice arises, for Aristotle can say that "the slave by nature and the master by nature have in reality the same interests." It is by the justice inherent in the relation of master and slave *when both are naturally so related* that Aristotle can criticize the injustice of all *conventional* forms of slavery. But the question of fact must be faced, as Aristotle himself is aware.

"Is there any one intended by nature to be a slave," he asks, "and for whom such a condition is expedient and right, or is all slavery a violation of nature?" Aristotle recognizes that "others affirm the rule of a master over slaves to be contrary to nature and that the distinction between slave and free man exists by law only, and not by nature, and being an interference with nature is therefore unjust." He himself questions the justice of making slaves of captives taken in war, for that may violate the natures of men of high rank who have had the misfortune to be captured or sold. But he thinks that the same kind of difference which exists between male and female—the male being by nature superior, the female inferior; the one ruling, the other submitting to rule—can be extended to all mankind.

"Where there is such a difference," Aristotle explains, "as that between soul and body, or between men and animals . . . the lower sort are by nature slaves, and it is better for them as for all inferiors that they should be under the rule of a master. For he who can be, and therefore is, another's and he who participates in a rational principle enough to apprehend, but not to have, such a principle, is a slave by nature; whereas the lower animals cannot even apprehend a principle; they obey their instincts. And indeed the use made of slaves and of tame animals is not very different; for both with their bodies minister to the needs of life . . . If men differed from one another in the mere forms of their bodies as much as the statues of the gods do from men, all would acknowledge that the inferior class should be slaves of the superior. And if this is true of the body, how

much more just that a similar distinction should exist in the soul . . . It is clear, then, that some are by nature free, and others slaves, and that for these latter slavery is both expedient and right."

According to the theory of natural slavery, it is as good for the slave to have a master as for the master to have a slave. This reciprocity of interest does not occur in legal or conventional slavery. In both types of slavery, the slave is a piece of property, a possession. Whether by nature or by institution, a slave does not own himself; he is another's man. "He may be called another's man," Aristotle says, "who, being a human being, is also a possession." Does this mean that the slave belongs wholly to the master, in all that he is and has? He would seem to belong to his master insofar as he is a *possession*; but not wholly—in all that he is and has—insofar as he is a *human being*. Aristotle does not introduce such a qualification where he says that "the slave is a part of the master, a living but separated part of his bodily frame"; yet he adds: "where the relation of master and slave is natural they are friends and have a common interest, but where it rests merely on law and force, the reverse is true."

Aristotle considers the difference between the natural slave and other forms of personal property, whether domestic animals, beasts of burden, or the inanimate instruments used in the household for productive purposes. Do slaves, he asks, have any excellence "beyond and higher than merely instrumental and ministerial qualities" of the sort to be found in tools and animals? Do they have virtues, and if so, then "in what way will they differ from freemen?"

Aristotle answers by saying that "since they are men and share in the rational principle, it seems absurd to say that they have no virtue." But since the rational principle in them is weak and consists only in the ability to execute decisions—not to make them or to know the end for which they are made—the slave will have a capacity for only so much virtue as he requires; enough virtue, for example, to "prevent him from failing in his duty through cowardice or lack of self-control."

It is precisely because of his limited competence and virtue that the slave needs, and

profits by having, a master. Aristotle thinks that he is better off than the artisan out of bondage. "The slave shares in his master's life; the artisan is less closely connected with him, and only attains excellence in proportion as he becomes a slave. The meaner sort of mechanic has a special and separate slavery, and whereas the slave exists by nature, not so the shoemaker or other artisan."

The "separate slavery" of the artisan makes him more like an animal or an inanimate tool in the way he is used; for, according to Aristotle, he is an instrument of production, while the natural slave participates in his master's life by being an instrument not of production, but of action. The work the slave does enables the master to live well—to achieve the happiness of the political or contemplative life—and since "life is action, not production . . . the slave is a minister of action." If the slave had in his own nature the capacity for human happiness, he would not be by nature a slave, nor be limited to the good of serving another man's happiness.

"Slaves and brute animals cannot form a state," Aristotle says, because "the state exists for the sake, not of life, but the good life" and slaves "have no share in happiness or in a life of free choice. . . . No one assigns to a slave a share in happiness," he says in another place, "unless he assigns to him also a share in human life." At best, that share could come only from being a part of the master and contributing to the master's happiness. But though to this extent "the slave by nature and the master by nature have in reality the same interests," the rule under which the slave lives "is nevertheless exercised primarily with a view to the interest of the master."

ARISTOTLE'S DOCTRINE OF natural slavery is rejected by those who affirm the fundamental equality of all men in their common humanity and who, in addition, insist that their inequality as individuals in talent or capacity, should not affect their status or determine their treatment. On these grounds, Roman Stoics and Christian theologians seem to agree—and with them such modern thinkers as Rousseau, Kant, Hegel, and Mill—that all men are by nature born to be free. Freedom, writes Kant, belongs "to every man in virtue of his Humanity. There is, in-

deed, an innate Equality belonging to every man which consists in his right to be independent of being bound to others . . . in virtue of which he ought to be *his own master by Right*." That "all persons are deemed to have a *right* to equality of treatment" seems to follow for Mill from the principle that "one person's happiness, supposed equal in degree (with the proper allowance made for kind), is counted for exactly as much as another's." The "equal claim of everybody to happiness" involves "an equal claim to all the means of happiness," among them freedom.

But though theologians like Augustine and Aquinas deny that slavery is instituted by nature, they do not seem to regard it as contrary to natural law or to the will of God. Something can be according to natural law in two ways, Aquinas says: "First, because nature inclines thereto. . . . Secondly, because nature does not require the contrary." Just as we can say, in the second sense, that nakedness is natural for man, "because nature did not give him clothes, but art invented them," so we can say that all men are by nature free because slavery was not instituted by nature, "but devised by human reason for the benefit of human life."

The institution of slavery, whereby one man belongs to another for his use, seems due to the fallen nature of man, as one of the penal consequences of original sin. If man had remained in a state of innocence, one man would have ruled another for the latter's good, but no man would have been the master of slaves to be used for the master's good. Since "it is a grievous matter to anyone to yield to another what ought to be one's own," it follows, says Aquinas, that "such dominion necessarily implies a pain inflicted on the subject." This painfulness of slavery in turn seems to imply a contradiction to Aristotle's view that slavery fits certain natures and is for their benefit.

"By nature, as God first created us," writes Augustine, "no one is the slave either of man or of sin." Both sorts of slavery are "introduced by sin and not by nature." Both are punishments for sin, though one seems to Augustine more grievous than the other. "It is a happier thing," he says, "to be the slave of a man than of a lust; for even this very lust of ruling . . .

lays waste men's hearts with the most ruthless dominion. Moreover, when men are subjected to one another in a peaceful order, the lowly position does as much good to the servant as the proud position does harm to the master."

Not sin, but climate, according to Montesquieu, is the cause of slavery and to some extent its excuse. Though he thinks that "the state of slavery is in its own nature bad . . . neither useful to the master nor to the slave," Montesquieu, like Hippocrates before him, regards the Asiatics as reduced to servility by the physical conditions of their life. "There reigns in Asia," he writes, "a servile spirit which they have never been able to shake off." Under Asiatic despotism, where whole peoples live in political servitude, domestic slavery is more tolerable than elsewhere. In those countries "where the excess of heat enervates the body and renders men so slothful that nothing but the fear of chastisement can oblige them to perform any laborious duty, slavery is . . . more reconcilable to reason."

Montesquieu seems to accept Aristotle's doctrine with some qualifications. "Aristotle endeavors to prove that there are natural slaves, but what he says is far from proving it. If there be any such, I believe they are those of whom I have been speaking." Slavery is both natural and unnatural. "As all men are born equal," Montesquieu declares, "slavery must be accounted unnatural, though in some countries it be founded on natural reason . . . Natural slavery, then, is to be limited to some particular parts of the world." But in arguing the right of Europeans "to make slaves of the negroes," he concludes with the equivocal remark that "it is impossible for us to suppose these creatures to be men, because, allowing them to be men, a suspicion would follow that we ourselves are not Christians."

Hegel's comment on the enslavement of African negroes by Europeans runs somewhat differently. "Bad as this may be," he writes, "their lot in their own land is even worse, since there a slavery quite as absolute exists." But though Hegel thinks that the negroes are naturally given to slavery, he regards "the 'natural condition' itself as one of absolute and thorough injustice." To remove this injustice, however, is not easy. "Man must be matured" for free-

dom, Hegel writes. "The gradual abolition of slavery is therefore wiser and more equitable than its sudden removal."

Mill also looks upon slavery as a stage in the rise of certain peoples from savagery to political life, and maintains that the transition to freedom must be gradually effected. "A slave properly so called," he says, "is a being who has not learnt to help himself. He is, no doubt, one step in advance of a savage. He has not the first lesson of political life still to acquire. He has learnt to obey. But what he obeys is only a direct command. It is the characteristic of *born* slaves to be incapable of conforming their conduct to a rule, or a law. . . . They have to be taught self-government, and this, in its initial stage, means the capacity to act on general instructions." Extenuations of the injustice of ruling men as slaves, such as those proposed by Hegel and Mill, are rejected by Rousseau.

The notion that some men are by nature slaves, whether in Asia or in Europe, seems to Rousseau to be an illusion due to the fact that those who are made slaves by force have had their natures debased to slavishness. Aristotle, he says, "took the effect for the cause. Nothing can be more certain than that every man born in slavery is born for slavery. Slaves lose everything in their chains, even the desire of escaping from them . . . If then there are slaves by nature, it is because there have been slaves against nature. Force made the first slaves, and their cowardice perpetuated the condition."

It is sophistry, he thinks, for philosophers to "attribute to man a natural propensity to servitude, because the slaves within their observation are seen to bear the yoke with patience; they fail to reflect that it is with liberty as with innocence and virtue; the value is known only to those who possess them, and the taste for them is forfeited when they are forfeited themselves."

THE ISSUE CONCERNING slavery as a social or legal institution does not seem to be resolved by the views men take of natural slavery. Aristotle, who holds that *only* natural slavery is justified, criticizes those who "affirm to be unjust and inexpedient in their own case what they are not ashamed of practising towards others; they demand just rule for themselves,"

he writes, "but where other men are concerned they care nothing about it. Such behavior is irrational, unless the one party is, and other is not, born to serve." This cannot be determined by conquest. Aristotle questions, therefore, the convention "by which whatever is taken in war is supposed to belong to the victors," or the principle that "because one man has the power of doing violence and is superior in brute strength, another shall be his slave and subject." Those who "assume that slavery in accordance with the custom of war is justified by law," are confronted by Aristotle with the question: "What if the cause of the war be unjust?"

Hobbes and Locke appear to take an opposite view. Men in a state of nature are free, though they can actually enjoy only as much freedom as they have power to secure. Yet the natural inequality in their powers does not establish a natural right on the part of the stronger to enslave the weaker. Hobbes makes the right of mastership or what he calls "despotical dominion" depend not merely upon victory in war, but upon a covenant into which the vanquished enter voluntarily, "when the vanquished, to avoid the present stroke of death, covenanteth . . . that so long as his life, and the liberty of his body, is allowed him, the victor shall have the use thereof at his pleasure." Only "after such covenant is made, the vanquished is a servant, and not before . . . It is not, therefore, the victory, that giveth the right of dominion over the vanquished, but his own covenant." That Hobbes means chattel slave when he says "servant," seems to be indicated by his remark that "the master of the servant is master also of all he hath, and may exact the use thereof; that is to say, of his goods, of his labour, of his servants, and of his children, as often as he shall think fit."

Locke disagrees with Hobbes that one man can give another the right to enslave him by contracting to become a slave in order to avoid death. "A man not having the power of his own life," he writes, "cannot by compact, or his own consent, enslave himself to anyone. . . . Nobody can give more power than he has himself; and he that cannot take away his own life, cannot give another power over it." As among the ancient Jews, men can sell themselves into temporary service to requite a debt. But this was a kind of drudgery, not slavery; "the per-

son sold was not under an absolute, arbitrary, despotical power, for the master could not have the power to kill him at any time, whom at a certain time he was obliged to let go free out of his service." No Jew, Aquinas concurs, "could own a Jew as a slave absolutely, but only in a restricted sense, as a hireling for a time. And in this way the Law permitted that through stress of poverty a man might sell his son or daughter."

Absolute slavery, for Locke, "is nothing else but the state of war continued between a lawful conqueror and a captive." It is lawful, he thinks, to kill a violent aggressor, "for to that hazard does he justly expose himself whoever introduces a state of war, and is aggressor in it." But he who has forfeited his life necessarily forfeits his freedom. Slaves, then, are those "who, being captives taken in a just war, are by right of nature subjected to the absolute dominion and arbitrary power of their masters." In contrast to the limited servitude which a man can contract for wages, absolute slavery "is the effect only of forfeiture which the aggressor makes of his own life when he puts himself into the state of war with another."

Against Locke and Hobbes, as well as Aristotle, Rousseau denies that there is any justice in slavery—by nature, by covenant or compact, or by right of war. To think as Hobbes appears to, that "the child of a slave comes into the world as a slave," is, in Rousseau's opinion, to say that "a man shall come into the world not a man." Holding that slavery is "contrary to nature," Rousseau also holds that it "cannot be authorized by any right or law." A man cannot alienate his freedom by selling himself into slavery, for "to renounce liberty is to renounce being a man."

In Kant's language, "a contract by which the one party renounces his *whole* freedom for the advantage of the other, ceasing thereby to be a person and consequently having no duty even to observe a contract, is self-contradictory, and is therefore of itself null and void." Agreeing that such a contract is a nullity, Hegel holds that the "slave has an absolute right to free himself," but he adds that "if a man is a slave, his own will is responsible for his slavery. . . . Hence the wrong of slavery lies at the door not simply of enslavers or conquerors, but of the slaves and the conquered themselves."

As for Grotius and the others who "find in war another origin for the so-called right of slavery"—on the ground that "the victor having . . . the right of killing the vanquished, the latter can buy back his life at the price of his liberty"—Rousseau thinks their argument begs the question. "The right of conquest," he says, "has no foundation other than the right of the strongest. If war does not give the conqueror the right to massacre the conquered peoples, the right to enslave them cannot be based upon a right which does not exist."

Since Rousseau denies that victory gives the victors a right to kill those who have laid down their arms, he regards it unfair to make the captive "buy at the price of his liberty his life, over which the victor holds no right. . . . From whatever aspect we regard the question," he concludes, "the right of slavery is null and void, not only as being illegitimate, but also because it is absurd and meaningless. The words *slave* and *right* contradict each other and are mutually exclusive."

IN MODERN AS WELL AS ancient times, in the European colonies in the New World if not in Europe itself, slave labor characterizes a certain type of economy and determines the mode of production, especially in agriculture and mining. The slave as chattel is bought and sold like other property. He may be a source of profit to his owner in exchange as well as in production. The traffic in slaves depends upon an original acquisition, either through the spoils of war or by the activity of slave traders who hunt men as if they were animals, to transport them in chains and sell them into slavery.

In the ancient world, individual slave owners emancipated their slaves, even as, under modern feudalism, a great landowner like Prince Andrew in *War and Peace* freed his serfs. Aristotle speaks of those in his own time who opposed the institution of slavery; and the Roman Stoics did a great deal to ameliorate the condition of the slave and to protect him legally against abuse. But there seems to have been no political party or active political movement among the ancients corresponding to the abolitionists and their struggle in the 18th and 19th centuries. Even then, however, the abolitionists were looked upon as a radical minority who had no

respect for the rights of property in their over-zealous sentimentality about the rights of men. Those who were willing to outlaw the African slave trade as outrageous were less outraged by the treatment of men as chattel, once they were possessed.

Madison, for example, referring to the prohibition affecting the importation of slaves into the United States, which the Constitution postponed until 1808, thinks it "a great point gained in favor of humanity, that a period of twenty years may terminate forever, within these States, a traffic which has so long and so loudly upbraided the barbarism of modern policy." But in another paper the writers of *The Federalist* present their version of the Southern argument defending the Constitution's apportionment of representation, "determined by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons." They do not object to the view of the negro slave as two-fifths property and three-fifths a person, confessing themselves reconciled to reasoning which, though "it may appear a little strained in some points," appeals to a principle they themselves approve, namely, that "government is instituted no less for the protection of property than of persons."

There are even those, in the 18th century, who defend the slave trade. Boswell reports an argument set forth by Dr. Johnson in favor of granting liberty to a negro, who claimed his freedom before a Scottish Court of Session. The sum of Dr. Johnson's argument, according to Boswell, came to this: "No man is by nature the property of another; the defendant is, therefore, by nature free. The rights of nature must be in some way forfeited before they can be justly taken away . . . and if no proof of such forfeiture can be given, we doubt not but the justice of the court will declare him free." Admitting that Johnson may have been right in the particular case at hand, Boswell protests his general attitude toward slavery and the slave trade.

"To abolish a status," Boswell writes, "which in all ages God has sanctioned, and man has continued, would not only be robbery to an innumerable class of our fellow-subjects; but it

would be extreme cruelty to the African savages, a portion of whom it saves from massacre, or intolerable bondage in their own country, and introduces into a much happier state of life, especially now when their passage to the West Indies and their treatment there is humanely regulated."

Issues of justice aside, economists like Smith and Marx question the productivity of slave labor. Improvements in machinery "are least of all to be expected," writes Smith, when the proprietors "employ slaves for their workmen. The experience of all ages and nations, I believe, demonstrates that the work done by slaves, though it appears to cost only their maintenance, is in the end the dearest of any. A person who can acquire no property, can have no interest but to eat as much, and to labor as little as possible." He explains the lack of mechanical progress in Greece and Rome by the fact that "slaves . . . are very seldom inventive; and all the most important improvements in machinery, or in the arrangement and distribution of work, which facilitate and abridge labor, have been the discoveries of free men."

Marx also judges "production by slave labor" to be "a costly process . . . The principle, universally applied in this method of production," is "to employ the rudest and heaviest implements and such as are difficult to damage owing to their sheer clumsiness. In the slave-states, bordering on the Gulf of Mexico, down to the date of the civil war, ploughs constructed on old Chinese models, which turned up the soil like a hog or a mole, instead of making furrows, were alone to be found."

But Marx does not limit his judgment of slavery to criteria of efficiency, nor does he limit his consideration of servitude to its more obvious forms of chattel slavery and feudal serfdom. For him, all use of labor by those who own the instruments of production involves exploitation; it differs only in the degree to which the owner derives a surplus value from the labor power he possesses, through property rights or wage payments.

According to Marx, "the essential difference between the various economic forms of society, between, for instance, a society based on slave labor and one based on wage labor, lies only in

the mode in which this surplus-labor is in each case extracted from the actual producer, the laborer." As all the value produced by a slave, in excess of the cost of keeping him alive, profits his owner, so during "the period of surplus-labor, the usufruct of the labor-power creates a value for the capitalist that costs him no equivalent . . . In this sense it is that surplus-labor can be called unpaid labor"—whether it is the labor of chattel or wage slaves.

Because a laborer is forced to sell his labor-power in the open market in order to subsist, Marx regards his so-called "freedom" as a pious fiction. "The contract by which he sold to the capitalist his labor-power proved in black and white," Marx writes, "that he disposed of himself freely. The bargain concluded, it is discovered that he was no 'free-agent,' that the time for which he is free to sell his labor-power is the time for which he is forced to sell it."

Others take the view that there is a fundamental moral difference between chattel slaves and men who work for wages. Hobbes, for example, thinks that between slaves who "are bought and sold as beasts" and servants "to whose service the masters have no further right than is contained in the covenants made betwixt them," there is only this much in common—"that their labor is appointed them by another." In slightly varying terms, Aquinas, Locke, and Kant make a similar distinction between the free servant, or paid worker, and the slave. The point is summarized by Hegel as a difference between alienating to someone else "products of my particular physical and mental skill," and alienating "the whole of my time, as crystallized in my work." In the latter case, "I would be making into another's property the substance of my being."

Debating with Douglas, Lincoln insisted that political freedom was the difference between the white slaves of the North and the black slaves of the South. The legal right, won by the proletariat, to organize and strike, seems to be a difference which Marx himself recognizes between the wage earner and the bonded slave. Until his chains are struck, the slave is not in the position of the free workingman to fight for political rights and privileges. Citizenship is not always extended to the laboring classes, but it is never conferred upon slaves.

OUTLINE OF TOPICS

	PAGE
1. The nature of enslavement: the relation of master and slave	783
2. The theory of natural slavery and the natural slave	784
2a. Characteristics of the natural slave: individual and racial differences in relation to slavery	
2b. The conception of the natural slave as the property or instrument of his master	
2c. Slavery in relation to natural or to divine law	
2d. Criticisms of the doctrine of natural slavery	785
3. Slavery as a social institution: the conventionality of slavery	
3a. The acquisition of slaves: conquest, purchase, indenture, forfeiture	
3b. Laws regulating slavery: the rights and duties of master and slave	786
3c. The emancipation or manumission of slaves: the rebellion of slaves	
3d. Criticisms of the institution of slavery: the injustice of slavery, its transgression of inalienable human rights	
4. The forms of economic slavery	787
4a. Chattel slavery: slaves of the household and slaves of the state	
4b. Serfdom or peonage	
4c. Wage slavery: the exploitation of the laborer	
5. The political aspect of economic slavery	
5a. The disfranchisement of chattel slaves and serfs: their exclusion from the body politic or political community	
5b. The political deprivations of the laboring classes or wage slaves: the struggle for enfranchisement; the issue between oligarchy and democracy with respect to suffrage	788
6. Political enslavement or subjection	
6a. Slavery as the condition of men living under tyrannical government	
6b. Subjection as the condition of men living under benevolent despotism or paternalistic government	
6c. The transition from subjection to citizenship: the conditions fitting men for self government	789
6d. The imperialistic subjection or enslavement of conquered peoples or colonial dependencies	
7. The analogy of tyranny and slavery in the relations between passions and reason or will: human bondage	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a 119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left hand side of the page, the letters c and d to the upper and lower halves of the right hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. The nature of enslavement: the relation of master and slave

Chapter 88: SOUL

INTRODUCTION

IN the language of the poets as well as in the discourse of the philosophers, body and soul are correlative terms. Each affects the meaning of the other. The words are used together in daily speech. Men who are unaware of, or deny, the metaphysical and theological significance of having a soul, nevertheless use the word "soul" with a sense of contrast to body, even if only to refer to vague manifestations of spirit—feelings and sympathies which seem to be alien to the world of matter.

With few exceptions, traditional theories of the soul involve its distinction from and relation to the body. Berkeley represents one of the major exceptions. Denying the reality of matter, he conceives the soul as existing in and by itself; souls or spirits differ from God as finite from infinite spiritual beings. The something "which knows and perceives" and which "exercises divers operations, as willing, imagining, remembering," Berkeley says, "is what I call *mind, spirit, soul, or myself*." Berkeley, therefore, would not speak of himself or other men as having souls, but rather as *being* souls.

The other major exception is exemplified by Lucretius. It is not that Lucretius denies soul as Berkeley denies body. Nor does he deny that soul adds something to body which differentiates living organisms from inorganic things. On the contrary, he declares the mind to be "a part of man no whit less than hand and foot and eyes are parts of the whole living being." Distinct from mind, soul is also part of a living being. "Mind and soul are held in union one with the other, and form of themselves a single nature," but whereas the mind is, as it were, the lord or head of the whole body, "the rest of the soul, spread abroad throughout the body, obeys and is moved at the will and inclination of the mind."

But when Lucretius refers to mind and soul

as parts of the body, he means no more than is implied in speaking of the hand and eye as parts of the body. "The nature of mind and soul is bodily," he writes. Just as flesh and bones are composed of atomic particles, so the mind is formed of atoms "exceeding small and smooth and round," and the soul is "made of very tiny seeds linked together throughout veins, flesh, and sinews."

APART FROM THESE exceptions, the traditional discussion of soul considers it as somehow conjoined with body to constitute a whole of which it is the immaterial principle or part. Even those who, like Descartes, define the soul as an immaterial substance, capable of existing by itself, do not actually ascribe to the human soul complete independence of the human body. Nor do the theologians who think of God as a purely spiritual being and of angels as immaterial substances attribute soul to them.

Precisely because God and the angels do not have bodies, neither do they have souls. Whether everything which has a body also has a soul is another question. It is variously answered; but certainly those who, like Plato and Plotinus, speak of a world-soul or a soul of the universe, confirm the point that soul is the co-principle or complement of body. The same point appears in theories of the celestial bodies which conceive them as being alive and as therefore having souls.

Unfolding to Socrates the story of the creation, Timaeus says: "Using the language of probability, we may say that the world became a living creature endowed with soul and intelligence by the providence of God." To the world, Timaeus explains, God "gave a body, smooth and even, having a surface in every direction equidistant from the center, a body entire and perfect, and formed out of perfect

bodies. And in the center, he put the soul which he diffused throughout the body, making it also to be the exterior environment of it."

Comparing the magnetic force of the loadstone with the animation of a soul, Gilbert says that "this one eminent property is the same which the ancients held to be a soul in the heavens, in the globes, and in the stars, in sun and moon. . . . The ancient philosophers . . . all seek in the world a certain universal soul, and declare the whole world to be endowed with a soul. Aristotle held that not the universe is animate, but the heavens only. . . . As for us," Gilbert writes, "we deem the whole world animate, and all globes, stars, and this glorious earth, too, we hold to be from the beginning by their own destinate souls governed Piteable is the state of the stars, abject the lot of earth, if this high dignity of soul is denied them, while it is granted to the worm, the ant, the roach, to plants and mores; for in that case, worms, roaches, moths, were more beauteous objects in nature and more perfect, inasmuch as nothing is excellent, nor precious, nor eminent, that hath not a soul."

On the question whether the earth, each heavenly body, or the whole world is endowed with life, intelligence, and soul, Kepler differs from Gilbert, Augustine from Plato and Plotinus, Aquinas from Aristotle. Nevertheless, the many-sided controversy indicates the traditional connection of soul with life and mind on the one hand, and with animate or organic bodies on the other—bodies which manifest certain properties and tendencies to motion.

THE MAJOR ISSUES CONCERNING soul seem to follow from these traditional associations. Does the soul which is somehow conjoined with a body exist as an immaterial substance or principle, in such a way that the being composed of body and soul consists of two distinct substances or entities, united as related parts of a whole? Or is the soul the substantial form of an organic body, with the consequence that the form and matter together constitute a single composite substance, which is the living thing? In the latter alternative the unity of soul and body, according to Aristotle, is like that of "the wax and the shape given to it by the die."

On either conception of soul and its relation

to body or matter, further questions arise concerning the soul's existence apart from the body. Does it exist before being united to the body? Does it exist after the union is dissolved? How does it exist when it exists separately or apart from matter? For those, like Lucretius, who conceive the soul as itself composed of material particles within the framework of the body, such questions can have little meaning. For those, like Plato and Descartes, who conceive the soul as an immaterial entity having being in its own right, these questions can be immediately answered in favor of the soul's capacity for separate existence. Only when the soul is conceived as a form which, together with matter, constitutes the substance of a living body, does there seem to be both meaning and difficulty to the question whether the soul continues to endure separately when a plant, an animal, or a man dies, *i.e.*, when such composite substances decompose.

If the individual soul ceases to be when the body with which it is somehow united perishes, it is as mortal as the body. The traditional theories of personal immortality—such as the Platonic myths concerning the transmigration or reincarnation of souls, and the Christian doctrine of man's immortal soul, specially created for union with the body, but destined to survive its separation from the body—are theories which involve conceptions of the soul as capable of self-subsistence. The controversy over these doctrines is dealt with in the chapter on IMMORTALITY. Here are we concerned to see how different implications for immortality necessarily follow from various theories of the soul.

Still other issues concerning soul arise in connection with other chapters. For example, the question whether soul is to be found only in living things, or only in animals but not in plants, or in man alone, is discussed in the chapters on LIFE AND DEATH and on MIND. If soul, on any conception, is the principle or cause of life, then the distinction between animate and inanimate bodies is identical with the distinction between things which have and things which do not have a soul. If, furthermore, the kind of life possessed by a vegetable or plant is radically different from animal life, and that in turn from human life, then souls, too, may have

to be differentiated in kind according to the mode of life or the range of vital powers of which each type is the principle.

Some writers, however, tend to equate "soul" with "mind" or "understanding." When, as by Descartes, soul is identified with rational soul or thinking substance, it is usually attributed to man alone. Soul is then not thought necessary to explain the phenomena of life in plants and animals, at least in no sense of soul which implies either an incorporeal or a formal principle; that is, anything beyond the complex interaction of organic parts. Other authors, like Locke, who conceive soul or understanding not merely in terms of rational thought, but also in terms of sensation, imagination, and memory, may exclude plants, but not animals, from the possession of soul or mind.

Descartes takes notice of these ambiguities in the traditional use of the word "soul." Probably because "men in the earliest times," he writes, "did not distinguish in us that principle in virtue of which we are nourished, grow, and perform all those operations which are common to us with the brutes . . . from that by which we think, they called both by the single name *soul*; then, perceiving the distinction between nutrition and thinking, they called that which thinks *mind*, believing also that this was the chief part of the soul. But I, perceiving that the principle by which we are nourished is wholly distinct from that by means of which we think have declared that the name *soul* when used for both is equivocal; and I say that, when soul is taken to mean the *primary actuality* or *chief essence of man*, it must be understood to apply only to the principle by which we think, and I have called it by the name *mind* as often as possible to avoid ambiguity; for I consider the mind not as part of the soul, but as the whole of that soul which thinks."

In another place, he uses the word "soul" to stand for "that subtle fluid styled the animal spirits" which, pervading the organs of brute animals, accounts for their peculiar type of animation. "We can recognize no principle of motion in them beyond the disposition of their organs and the continual discharge of the animal spirits that are produced by the beat of the heart as it rarefies the blood." Soul in this sense is not to be confused with "the incorporeal and

spiritual nature of man's soul." It is "something corporeal, of a fine structure and subtle, spread throughout the external body, and the principle of all sensation, imagination, and thought. Thus there are three grades of being, Body, the Corporeal or soul, and Mind or spirit."

IN THE OPENING PAGES of his treatise *On the Soul*, Aristotle says that "to attain any assured knowledge about the soul is one of the most difficult things in the world." The difficulty seems to apply both to *what the soul is* and to *whether it exists*. The questions are connected. Even Lucretius, who regards the soul as material in nature, does not claim to know its existence by direct observation. It is not, like the body itself or like other parts of the body, a sensible object. It must be inferred to exist. Just as the existence of unobservable atoms is inferred in order to explain the constitution and change of all natural objects, so the existence of soul is inferred in order to explain the constitution and motion of living things. Those who conceive the soul as immaterial—whether as substance, principle, or form—would seem to face an even greater difficulty in establishing its existence and in describing its nature. Admittedly, the soul as some sort of immaterial being cannot be discovered by observation and experiment. The alternatives, which represent traditional solutions of the problem, seem to include the soul's reflexive knowledge of its own existence, inferential knowledge about the soul based on observed facts, various religious beliefs concerning the nature and destiny of the soul, and the postulation of the soul's existence on practical, not theoretic, grounds.

Not all writers agree with Aristotle that the soul is an object difficult to know, or with Kant that it is absolutely impossible for us to reach any sound theoretic conclusions about the soul's existence. Descartes, for example, says that if there are "any persons who are not sufficiently persuaded of the existence of God and of the soul by the reasons which I have brought forward, I wish them to know that all other things of which they perhaps think themselves more assured (such as possessing a body, and that there are stars and an earth and so on) are less certain."

The argument for the soul's existence which

precedes this remark is the famous *Cogito, ergo sum*—"I think; therefore, I am." From the fact that, in the very act of doubting the existence of everything else, he could not doubt that he was doubting, and hence thinking, Descartes assures himself of his own existence, or, more precisely, of the existence of himself as a thinking being. "I knew," he writes, "that I was a substance the whole essence or nature of which is to think, and that for its existence there is no need of any place, nor does it depend on any material thing; so that this 'me,' that is to say, the soul by which I am what I am, is entirely distinct from body, and is even more easy to know than is the latter; and even if the body were not, the soul would not cease to be what it is."

Locke appears to agree that "if I doubt of all other things, that very doubt makes me perceive my own existence, and will not suffer me to doubt of that. . . . I have as certain perception of the existence of the thing doubting," he goes on, "as of that thought which I call doubt. Experience then convinces us that we have an intuitive knowledge of our own existence, and an internal infallible perception that we are."

But Locke does not turn the proposition that a thinking being exists into the assertion that a spiritual being, the soul as an immaterial substance, exists. "We have the idea of matter and thinking," he writes, "but possibly shall never be able to know whether any mere material being thinks or no; it being impossible for us, by the contemplation of our own ideas, without revelation, to discover whether Omnipotency has not given to some systems of matter fitly disposed, a power to perceive and think, or else joined and fixed to matter so disposed, a thinking immaterial substance: it being, in respect of our notions, not much more remote from our comprehension to conceive that God can, if he pleases, superadd to matter a faculty of thinking, than that he should superadd to it another substance with a faculty of thinking."

For Locke, however, our idea of soul is as clear as our idea of body. "Our idea of body," he says, "is an extended, solid substance capable of communicating motion by impulse; and our idea of soul, as an immaterial spirit, is of a substance that thinks, and has a power of exciting

motion in body, by willing or thought . . . I know that people whose thoughts are immersed in matter, and have so subjected their minds to their senses, that they seldom reflect on anything beyond them, are apt to say, that they cannot comprehend a thinking thing; which, perhaps, is true: but I affirm, when they consider it well, they can no more comprehend an extended thing." And in another place, he adds: "If this notion of immaterial spirit may have, perhaps, some difficulties in it, not easy to be explained, we have, therefore, no more reason to deny or doubt the existence of such spirits, than we have to deny or doubt the existence of body, because the notion of body is cumbered with some difficulties, very hard, and, perhaps, impossible to be explained or understood by us."

Berkeley differs from Locke not only in maintaining that we have no idea of matter at all, but also in holding that, if we use the word "idea" for sense-impressions or the images derived from them, we can have no idea of soul or spiritual substance. But we can, he thinks, form what he calls a "notion" of the soul, which grasps the meaning of the word "spirit" as signifying "that which thinks, wills, or perceives." He differs from Locke further in proportion as he tends to agree with Descartes, asserting that the existence of a spiritual substance, a thinking being, necessarily follows from the undeniable existence of thinking itself.

For both Descartes and Berkeley, the immortality of the soul can be directly concluded from our knowledge of the soul's existence and nature. "The soul," writes Berkeley, "is indivisible, incorporeal, unextended, and it is consequently incorruptible. Nothing can be plainer than that the motions, changes, decays and dissolutions which we hourly see befall natural bodies . . . cannot possibly affect an active, simple, uncompound substance; such a being therefore is indissoluble by the force of nature; that is to say, 'the soul of man is naturally immortal.'"

The arguments in Plato's *Phaedo* for the proper existence of the soul before it joins a particular body, and for its existence after it leaves the body to dwell apart before entering another body—arguments, in short, for the

soul's immortality—seem to stem from a slightly different principle. It is not merely that the soul is simple or uncompounded and hence indissoluble, or that the knowledge we have of the absolute ideas requires us to posit a principle of knowledge other than the bodily senses which can apprehend only changing things. In addition, Socrates argues that the knower must be like the known. If it is the soul which knows the unchangeable and eternal essences, it must be as unchangeable and eternal as they are. When the soul uses "the body as instrument of perception," Socrates says, it is "then dragged by the body into the region of the changeable . . . But when returning into herself she reflects, then she passes into the other world, the region of purity, and eternity, and immortality, and unchangeableness, which are her kindred."

AGAINST ANY FORM of argument for the existence and immortality of the human soul which proceeds from the nature of our thought or knowledge, Kant takes the position that the premises do not warrant the conclusion. He claims to expose the fallacies in what he calls the "paralogism of a rational psychology." The "I" of the *Cogito, ergo sum* may be the necessary logical subject of all our judgments, but this does not give us intuitive knowledge of a really existing substance which has the attributes of simplicity, spirituality, and permanence or immortality.

"In all our thinking," Kant writes, "the I is the subject in which our thoughts are inherent; nor can that I ever be used as a determination of any other thing. Thus everybody is constrained to look upon himself as the substance, and on thinking as the accident of his being." But, he goes on, "though the I exists in all thoughts, not the slightest intuition is connected with that representation by which it might be distinguished from other objects of intuition. . . . Hence it follows that in the first syllogism of transcendental psychology reason imposes upon us an apparent knowledge only, by representing the constant logical subject as the knowledge of the real subject in which that knowledge inheres. Of that subject, however, we have not and cannot have the slightest knowledge: . . . In spite of this, the proposition that the soul is a substance may well be allowed

to stand, if only we see that this concept cannot help us on in the least or teach us any of the ordinary conclusions of rational psychology, as, for instance, the everlasting continuance of the soul amid all changes and even in death; and that it therefore signifies a substance in idea only, and not in reality."

Similarly with respect to the simplicity of the soul, Kant contends that the absolute, but merely logical, unity of apperception or thought is illegitimately converted into the absolute unity of a real substance. The proposition, *I am a simple substance*, he declares, "teaches us nothing at all with reference to myself as an object of experience." Its only value is to enable us "to distinguish the soul from all matter, and thus to exempt it from that decay to which matter is at all times subject."

To this extent, rational psychology may "guard our thinking self against the danger of materialism." The concept of the soul as an immaterial and simple substance may thus function regulatively, but we deceive ourselves with the illusion of knowledge when we treat that concept as if it had intuitive content—when, as he says, we change "thoughts into things." Kant does not deny that the "I" is substantial in concept or simple in concept. Though these propositions are "incontestably true," he says, "nevertheless, what we really wish to know of the soul, becomes by no means known to us in that way, because all these predicates are with regard to intuition non-valid, entailing no consequences with regard to objects of experience, and therefore entirely empty."

The existence and immortality of the soul is, for Kant, a postulate or demand of the practical reason. "Of the psychic substance, regarded as an immortal soul, it is absolutely impossible to obtain any proof from a theoretical point of view," but if such an object must be thought *a priori* in order for "pure practical reason to be used as duty commands," it becomes what Kant calls "matter of faith." Immortality seems to him rationally required as the practically necessary condition for the fulfillment of the moral law and the endless progress of the soul toward holiness of will.

William James questions even such practical arguments for the soul. The imperishability of

a simple substance does not, he thinks, guarantee "immortality of a sort *we care for*." Nor, following Locke, does it seem to him that a substantial soul is required for personal identity and moral responsibility. Writing as an empirical or scientific psychologist, who feels "entirely free to discard the word Soul" because he finds the concept useless "so far as accounting for the actually verified facts of conscious experience goes," James tells those who may find "any comfort in the idea" that they are "perfectly free to continue to believe in it; for our reasonings have not established the non-existence of the Soul; they have only proved its superfluity for scientific purposes."

JAMES' CONCLUSION THAT "the substantial Soul . . . explains nothing and guarantees nothing," along with the arguments of Kant and Locke, may not apply to the soul conceived as the principle of life rather than as the agent of thought, or to the soul conceived as the form of an organic body rather than as a spiritual being associated with or somehow imprisoned in the body. Precisely because this other conception affirms reality of soul as something other than a complete substance, precisely because it applies to plants and animals as well as men, this other conception of soul would seem to require a different sort of criticism.

The Greek and Latin words—*psyche* and *anima*—which we translate by "soul" seem to have life as their primary connotation. In the *Cratylus*, Socrates suggests that "those who first used the name *psyche* meant to express that the soul when in the body is the source of life, and gives the power of breath and revival." Other dialogues express the Greek conception of the living thing as that which has the power of self-motion, and ascribe this power to the soul as source. In the *Phaedo*, for example, Socrates asks, "What is that the inheritance of which will render the body alive?" to which Cebes answers, "Soul," and agrees with Socrates' further statement that "whatever the soul takes possession of, to that she comes bearing life." In the *Laws*, Cleinias having identified the power of self-motion with life, the Athenian Stranger gains his assent to the proposition that whatever has life or self-motion also has soul.

To this much Aristotle also agrees. "What has soul in it," he says, "differs from what has not, in that the former displays life"; to which he adds that "living may mean thinking or perception or local movement, or movement in the sense of nutrition and growth," so that we must "think of plants also as living," and as having souls. But Aristotle goes further. In defining soul as the cause of life, and in differentiating three kinds of souls—vegetative, sensitive, and rational—according to the vital powers manifested by the activities of plants, animals, and men, he uses his general theory of corporeal substances to state precisely what the soul is and how it is related to the body.

Corporeal substances are, according to him, all composite of two principles, form and matter. "What is called matter is potentiality, what is called form, actuality." As exemplified in works of art, wood is the matter which has the potentiality for a certain shape and a certain function that is the actuality or form of a chair. In the case of natural things, that which determines "the essential whatness" of a body is its form or, as Aristotle sometimes says, "its formulable essence."

If living things are essentially distinct from inert bodies, as Aristotle supposes them to be, then the forms which determine their essences must be different from the forms of inanimate substances. It is this difference in forms which Aristotle appropriates the word "soul" to signify. In each kind of living thing, the soul is the substantial form or "the first grade of actuality of a natural body having life potentially in it."

He speaks of the first grade of actuality here to distinguish merely being alive or besouled from the various acts which, as operations of the vital powers, constitute living. If an axe or an eye had a soul, it would consist of its power to cut or to see, not in its actually cutting or seeing. While nourishing or thinking "is actuality corresponding to the cutting and the seeing, the soul is actuality in the sense corresponding to the power of sight and the power in the tool . . . As the pupil *plus* the power of sight constitutes the eye, so the soul *plus* the body constitutes the animal."

From this conception of soul as the form or actuality of a living substance, "it indubitably

follows," Aristotle says, "that the soul is inseparable from its body, or at any rate certain parts of it are—for the actuality of some of them is nothing but the actualities of their bodily parts." Where Plato holds that the soul is prior in existence to the body, Aristotle holds that soul and body come into existence together when the organism is generated. Where Plato attributes an independent mode of being to the soul, distinct in character from that of bodies, Aristotle says that "the soul cannot be without a body. Yet it cannot *be* a body; it is not a body, but something relative to a body. That is why it is *in* a body and a body of a definite kind," being nothing more than "the actuality or formulable essence of something that possesses the potentiality of being besouled."

FURTHER CONSEQUENCES follow from these conflicting conceptions of soul. In the *Timaeus*, Plato advances the view that only the lowest grade of soul—the plant soul—is mortal, in contrast to the souls of animals and men. Aristotle would seem to attribute mortality to every grade of soul. If any exception is to be made, it is only for the human soul because it involves the power of rational thought. Mind or the power to think, he writes, "seems to be a widely different kind of soul, differing as what is eternal from what is perishable."

The critical point is whether thinking, unlike all other psychic powers, is an activity of the soul alone. For the most part, "there seems to be no case in which the soul can act or be acted upon without involving the body.... Thinking seems the most probable exception; but," Aristotle adds, "if this too proves to be a form of imagination or to be impossible without imagination, it too requires a body as the condition of its existence. If there is any way of acting or being acted upon proper to soul, soul will be capable of separate existence; if there is none, its separate existence is impossible."

Is there any way of acting or being acted upon proper to soul? Aristotle seems to answer this question affirmatively when he says that "insofar as the realities it knows are capable of being separated from their matter, so is it also with the powers of mind." On one interpreta-

tion this means that the mind or intellect is as immaterial in its mode of operation as some of its objects are in their mode of being; with the further consequence that what is capable of acting apart from body is also able to exist apart from body. But whether Aristotle's further statement that "mind set free from its present conditions . . . is immortal and eternal" applies to the intellect alone or to the rational soul as a whole, has been disputed by various interpreters. Adopting Aristotle's conception of soul as the form which is the actuality of life in an organic body, Aquinas for one seems to think that the immortality of a rational soul can be demonstrated from the special character of its intellectual powers.

A theory of the soul which regarded it as a simple and incorporeal substance, or as having a being independent of the body, would seem to harmonize more readily with the Christian belief in the human soul's special creation and its individual survival after death. But Aquinas rejects such a theory on the ground that then man would be two substances or two beings, not one; or else if the human person is identified with the soul, man would be a soul using a body rather than a single substance of composite nature. The doctrine of body and soul which holds them to be related as matter and form, preserves the unity of man and, in the opinion of Aquinas, fits the way in which man learns through his senses, experiences passions, and, in thinking, depends upon imagination.

But though he admits that men cannot think without images, Aquinas also insists, contrary to Locke, that thinking, insofar as it involves abstract concepts, cannot be performed by matter. To make matter think is beyond even the power of God. Unlike nourishing or sensing, *understanding* is not and cannot be "the act of a body, nor of any corporeal power."

This theory—that the acts of understanding by which the intellect abstracts and receives universal concepts cannot be accounted for by the motions of the brain—is further discussed in the chapter on UNIVERSAL AND PARTICULAR. Here we are concerned simply to note that, for Aquinas, the fact that the concepts with which men think are universal, means that they are abstracted from matter; and the fact that they are abstracted from matter means that the

various acts of understanding must also be immaterial—that is, not acts of bodily organs like the brain. To these premises Aquinas adds one further principle, namely, that a thing's mode of being is indicated by its mode of operation. In these terms he concludes that, since the intellect has "an operation *per se* apart from the body," the human soul, which is called rational because of its power of understanding, can have a being *per se* apart from the body. Hence it is "something incorporeal and subsistent."

Nevertheless, according to Aquinas, though the human soul can subsist separately, it belongs to its nature to be embodied, that is, to be the form of a material substance. "The soul, as part of human nature," he writes, "has its natural perfection only as united to the body. Therefore it would have been unfitting for the soul to be created without the body." Furthermore, if the entire nature of man were to be a soul—the soul making "use of the body as an instrument, or as a sailor uses a ship"—there would be no need for the resurrection of the body after the Last Judgment. The Christian dogma of the resurrected body more properly accords, in Aquinas' view, with a conception of soul "united to the body as form to matter"; for, as he says in another place, "if it is natural to the soul to be united to the body, it is unnatural for it to be without a body, and as long as it is without a body it is deprived of its natural perfection."

In the consideration of the relation of body and soul, an opposite estimation of the body's role goes with an opposite theory of the soul's nature. Socrates, in the *Phaedo*, describes the body as the soul's prison-house, or worse, the source of the soul's contamination by the im-

purities of sense and passion. "In this life," he says, "we make the nearest approach to knowledge when we have the least possible intercourse or communion with the body, and are not surfeited with the bodily nature." But complete purification requires "the separation of the soul from the body . . . the release of the soul from the chains of the body." That is why, Socrates tells his friends gathered in the cell where he is to drink the hemlock, "true philosophers are ever seeking to release the soul" and "are always occupied in the practice of dying."

It is also the opinion of Plotinus that it is evil for the soul to be in the body. But Christian theologians, for the most part, take a contrary view. Aquinas, for example, criticizes Origen for holding that "souls were embodied in punishment of sin." To him there is nothing "of a penal and afflicting nature" in the soul's union with the body. Though Scripture says that "the corruptible body weigheth down the soul, and the earthly tabernacle presseth down the mind," Augustine interprets this to mean, not that the flesh is evil in itself, but that man is beset by sin when "the flesh lusteth against the spirit."

"There is no need, therefore," according to Augustine, "that in our sins and vices we accuse the nature of the flesh to the injury of the Creator, for in its own kind and degree the flesh is good." Man is both body and soul, human nature is a thing of both flesh and spirit, and "he who extols the nature of the soul as the chief good," Augustine continues, "and condemns the nature of the flesh as if it were evil, assuredly is fleshly both in his love of the soul and his hatred of the flesh."

OUTLINE OF TOPICS

. Conceptions of soul

- 1a. Soul as the ordering principle of the universe: the world soul and its relation to the intellectual principle; the souls of the heavenly bodies
- 1b. Soul as the principle of self-motion or life in living things: soul as the form of an organic body
- 1c. Soul as the principle of distinction between thinking and non-thinking beings: the identity or distinction between soul and mind or intellect
- 1d. Soul as the principle of personal identity: the doctrine of the self; the empirical and the transcendental ego

2. The analysis of the powers of the soul	801
2a. The distinction between the soul and its powers or acts	
2b. The order, connection, and interdependence of the parts of the soul: the id, ego, and super-ego in the structure of the psyche	802
2c. The kinds of soul and the modes of life: vegetative, sensitive, and rational souls and their special powers	
(1) The vegetative powers: the powers proper to the plant soul	
(2) The sensitive powers: the powers proper to the animal soul	803
(3) The rational powers: the powers proper to the human soul	
3. The immateriality of the soul	804
3a. The soul as an immaterial principle, form, or substance	
3b. The immateriality of the human soul in comparison with the materiality of the plant and animal soul: the intellect as an incorporeal power	
3c. The relation of soul and body: the relation of formal and material principles, or of spiritual and corporeal substances	
3d. The denial of soul as an immaterial principle, form, or substance: the atomic theory of the soul	805
3e. The corporeal or phenomenal manifestation of disembodied souls as ghosts, wraiths, or spirits	
4. The being of the soul	806
4a. The unity of the human soul: the human mode of the vegetative and sensitive powers	
4b. The issue concerning the self-subsistence or immortality of the human soul: its existence or capacity for existence in separation from the human body	
4c. The origin of the human soul: its separate creation; its emanation or derivation from the world soul	807
4d. The life of the soul apart from the body	
(1) The doctrine of transmigration or perpetual reincarnation	
(2) Comparison of separated souls with men and angels	
(3) The need of the soul for its body: the dogma of the body's resurrection for the soul's perfection	808
(4) The contamination of the soul by the body: the purification of the soul by release from the body	
5. Our knowledge of the soul and its powers	
5a. The soul's knowledge of itself by reflection on its acts: the soul as a transcendental or noumenal object; the paralogisms of rational psychology	
5b. The concept of the soul in empirical psychology: experimental knowledge of the soul	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b 164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

1. Conceptions of soul

1a. Soul as the ordering principle of the universe: the world soul and its relation to the intellectual principle; the souls of the heavenly bodies

- 7 PLATO: *Cratylus*, 93c-d / *Phaedrus*, 124b-d / *Apology*, 204d-205a / *Phaedo*, 241b-242b / *Timaeus*, 447a-455d esp 449c-450c / *Philebus*, 618b 619d / *Laws*, BK X, 757d-765d esp 762b-765d; BK XII, 797c-798b

Chapter 89: SPACE

INTRODUCTION

ON the level of our everyday observations, space and time seem to be the obvious, the common, and the connected properties of physical things. We distinguish things from one another by their position in space, as we mark happenings by the date of their occurrence. The where and when of a thing is often used to identify it, for it is generally agreed that two bodies cannot occupy the same place at the same time, and that at the same time two distinct places cannot be occupied by the same body. According to a theologian like Aquinas, these limitations of space and time apply even to bodiless things, *i.e.*, to angels.

"An angel and a body are said to be in a place," he writes, "in quite a different sense." Whereas a body is in the place which contains it, "an angel is said to be in a corporal place by application of the angelic power . . . not as being contained, but as somehow containing it." It follows, nevertheless, that at a given time an angel "is not everywhere, nor in several places, but in only one place." Nor does the incorporeality of angels permit more than one angel to be at the same time in the same place. According to the manner in which an angel is at a place—by the action of his power—"there can be only one angel in one place," Aquinas declares, even as there can be only one body in one place at a time.

Location or position in space, and spatial relationships such as higher and lower, nearer and farther, are so familiar and intelligible that they provide terms of reference whereby men speak metaphorically of the moral hierarchy and spiritual distances. The whole of Dante's *Divine Comedy*, for example, involves a spatial metaphor which sets forth the gradations of sin and the degrees of blessedness in terms of places beneath the earth and in the heavens above.

As he mounts from sphere to sphere in Para-

dise, Dante meets Piccarda Donati in the Heaven of the Moon. She explains to him that this place "which appears so far down," is assigned to those who have violated their vows in some particular. Dante wonders why she and the others do not "desire a more exalted place, in order to see more." Piccarda replies: "Brother, virtue of charity quiets our will, and makes us wish only for that which we have, and quickens not our thirst for aught else. . . . So that as we are, from seat to seat throughout this realm, to all the realm is pleasing, as to the King who in-wills us with His will; and His will is our peace."

This speech of Piccarda's makes it clear to Dante "how everywhere in Heaven is Paradise, even if the grace of the Supreme Good does not there rain down in one measure." These different measures of beatitude in the diffusion of God's love and light are represented by the celestial spheres from the earth-adjacent moon to the Crystalline Heaven, the outermost bound of the physical universe, of which Dante says that it "has no other Where than in the Divine Mind."

WHEN THE WHOLE EXPANSE of physical space or the boundary of the universe is considered, Newton no less than Dante conceives the omnipresence and eternity of God as that which somehow encompasses all space and time. God "is not duration or space," Newton writes at the end of the *Principles*, "but He endures and is present . . . and by existing always and everywhere, He constitutes duration and space." In the concluding queries of the *Optics*, Newton appears to think of infinite space as the Divine Sensorium in which all things are at once present to God, who "being in all places is more able by His will to move the bodies within His boundless uniform sensorium, and thereby to form and reform the parts of the Universe, than

we are by our will to move the parts of our own bodies."

The physicist does not have to turn theologian, however, to be confronted with the mysteries of space. Even without the modern complication of the relation of its three dimensions to time as a fourth dimension, the physical concept of space raises difficulties for analysis.

In the tradition of western thought conflicting definitions of space seem to result from a fundamental difference in the object being defined—whether it is an inseparable property of bodies, perhaps even identical with unformed matter, or a reality apart from the bodies which move and have their being in it. Sometimes this difference is signified by a difference between the meaning of the word "place" or "extension" and the meaning of "space." It appears also to be involved in the contrast between filled space and empty space (*i.e.*, the void or vacuum); and it bears some relation to Aristotle's distinction between space and place, and to Newton's distinction between absolute and relative space.

The controversial character of space in physical theory may be appreciated in terms of these oppositions in meaning, and the issues which they raise. In addition, physical theory is confronted with the problem of action-at-a-distance (*i.e.*, action through a void or through an ethereal medium), the problem of the infinity of space (or the question of a bounded or unbounded universe), and the distinction between one physical space and the variety of geometrical spaces.

Space, which at first seems easily apprehended by sense and susceptible to measurement, becomes upon examination so subtle as to be almost a vanishing object. Reason finds it difficult to say precisely *what* space is in itself, and how it is related to matter and motion. Even the familiar space of ordinary sense-perception seems to have its puzzles. A psychologist like James is concerned with how the different fields of touch, vision, and hearing coalesce to form the single space of our experience; and in dealing with the process by which we learn to perceive the spatial manifold of positions and directions, he cannot avoid the issue of innate as opposed to acquired space-perception.

PLATO'S THEORY OF SPACE is set forth in the *Timaeus* as part of "the likely story" which Timaeus tells about the production and constitution of the universe. The sensible things which come into being and pass away are, according to him, patterned after the eternal forms. To the eternal patterns and their copies in the world of change, Timaeus finds it necessary to add a third factor in order to account for the physical elements and their generation. This factor, he says, is "difficult to explain and dimly seen. . . . It is the receptacle, and in a manner the nurse, of all generation." In contrast to the elements which are perpetually changing into and out of one another, the receptacle "never departs from her own nature, and never in any way assumes a form like that of any of the things which enter into her. . . . The forms which enter into and go out of her are the likenesses of real existences modelled after their patterns in a wonderful and inexplicable manner."

Timaeus distinguishes the three principles as that which comes to be and passes away in the process of generation, that in which the generation takes place, and that which the generated thing resembles and which is its source. He likens the receptacle or "receiving principle to a mother, the source to a father, and the intermediate nature to a child," and adds that "if the model is to take every variety of form, then the matter in which the model is fashioned will not be duly prepared, unless it is formless and free from the impress of any of those shapes which it is hereafter to receive from without. . . . Wherefore, that which is to receive all forms should have no form. . . . The mother and receptacle of all created, visible, and in any way sensible things, is not to be termed earth, or air, or fire, or water, or any of their compounds, or any of the elements from which these are derived, but is an invisible and formless being which receives all things, and in some mysterious way partakes of the intelligible, and is most incomprehensible."

This third factor which Timaeus sometimes calls "matter," as well as "receptacle," he also sometimes calls "space." When matter and space are identified with each other under the conception of a receptacle for the forms, they have the characteristics of being absolutely

formless and imperceptible to the senses. Nor are they, as are the forms, genuinely intelligible to reason. "The third nature, which is space, and is eternal," Timaeus says, "admits not of destruction and provides a home for all created things, and is apprehended without the help of sense, by a kind of spurious reason, and is hardly real; which we behold as in a dream, say of all existence that it must of necessity be in some place and occupy a space, but that which is neither in heaven nor on earth has no existence."

The precise meaning of this conception of space is difficult to determine. Does it, for example, find an echo in Plotinus' statement that "space is a container, a container of body; it is the home of such things as consist of isolated parts"? But he also says that space "in a strict sense is unembodied and is not, itself, body," and that "body is not a void," but rather that "the void must be that in which body is placed," seeming thereby to imply that space is essentially the void. The statement in the *Timaeus* that "there can be no such thing as a vacuum," may apply only to the filled space of the created heaven and earth. May it not also be said that space is a void when it is identified with the formless matter of the receptacle prior to creation?

This raises further questions. Is the receptacle space or matter? And is the conception of space in the *Timaeus* rightly interpreted by Aquinas, in commenting on Augustine's reading of "the earth was void and empty" in Genesis 1:2? Augustine holds that by the word "earth" in this passage formless matter is to be understood. Because of its formlessness, Aquinas writes, "the earth is said to be *void and empty*, or *invisible and shapeless*," and, he adds, "that is why Plato says matter is place."

HOWEVER THESE QUESTIONS are answered, one thing seems to be clear. Space, functioning as receptacle, can be identified only with matter devoid of form, not with the matter of three-dimensional bodies. The relation of space to matter seems to be differently conceived by Descartes. Space is for him not an antecedent principle involved in the original production of sensible things, but rather—as the extension of bodies—it is inseparable in existence from them. It is a property which signifies the essence of

material substances, as thinking signifies the essence of mind or soul. "By extension," Descartes writes, "we understand whatever has length, breadth, and depth, not inquiring whether it be a real body or merely space." Nevertheless, he goes on to say that "by extension we do not here mean anything distinct and separate from the extended object itself."

Descartes considers the significance of three statements: "*extension occupies place*, *body possesses extension*, and *extension is not body*." The first statement, he thinks, means no more than "*that which is extended occupies place*." The second statement seems to imply that "the meaning of *extension* is not identical with that of *body*; yet," Descartes insists, "we do not construct two distinct ideas in our imagination, one of body, the other of extension, but merely a single image of extended body; and from the point of the view of the thing it is exactly as if I had said: *body is extended*, or better, *the extended is extended*." Finally, in the statement that *extension is not body*, the word "extension," according to Descartes, expresses a purely abstract conception—nothing which in itself has any sensible reality. So far as its existence is concerned, the thing conceived as extension cannot be separated from body. Those who think otherwise, Descartes asserts, are involved in "the contradiction of saying that *the same thing is at the same time body and not body*."

The point is summarized in his *Principles of Philosophy* by the statement that "the nature of matter or of body in its universal aspect, does not consist in being hard, or heavy, or colored . . . but solely in the fact that it is a substance extended in length, breadth, and depth." But, it may be asked, are the dimensions of a body the same as space? Descartes replies that "the same extension which constitutes the nature of a body constitutes the nature of space . . . not only that which is full of body, but also of that which is called a vacuum."

If there were a vacuum, or empty space, extension might be separated from body. This Descartes flatly denies. "As regards a vacuum in the philosophic sense of the word, *i.e.*, a space in which there is no substance, it is evident that such cannot exist, because the extension of space or internal place is not different from that of body." And even "when we take

this word vacuum in its ordinary sense," Descartes goes on, "we do not mean a place or space in which there is absolutely nothing, but only a place in which there are none of those things which we expected to find there."

These points made in the *Principles* confirm the identification of three-dimensional space or extension with body which appears in the *Rules*. They seem to be further confirmed in the *Discourse* by the reference to "a continuous body, or a space indefinitely extended in length, height or depth" which is "the object of the geometricians." Descartes does not, however, neglect the distinction between space as the extension of body, and place as the position one body occupies in relation to another. According to common usage, he says, the word "place" signifies that "in virtue of which a body is said to be here or there." He objects to those who, like Aristotle, mean by "place" the surrounding surface of a body. Local motion or change of place is not, he argues, a change in the body's surrounding surface, but a change in its relative position.

IT IS PLACE RATHER THAN space which Aristotle seeks to define, and place in the sense of the circumference of a body rather than its position in space. He rejects the notion that place is the extension of a magnitude, for that would, he thinks, identify it with matter. Place belongs to body, not as matter or a property of matter, but as its boundary. It is, Aristotle writes, "the innermost motionless boundary . . . a kind of surface and, as it were, a vessel, *i.e.*, a container of the thing." This boundary is itself made at the surface of a body by a surrounding body or bodies. "If a body has another body outside it and containing it," Aristotle writes, "it is in place, and if not, not."

The consequences of this conception of place are, first, a denial of space in the sense of void or empty place, since place is always "coincident with the thing" contained or bounded; second, a denial of any infinite place, since that would presuppose an actually infinite body—to Aristotle, an impossibility; and third, the conclusion that the whole universe itself does not have a place, for outside the outermost heaven which bounds the world, there can be no containing body by which the universe is bounded.

Aristotle explains that by "heaven" he means "the extreme circumference of the whole"—a whole "composed of all natural perceptible body." The two words which Einstein uses when he discusses "the possibility of a 'finite' and yet 'unbounded' universe" seem to apply to Aristotle's conception of the world—finite in body or matter, yet unbounded, *i.e.*, without anything outside itself to determine or define its boundary.

Aristotle's view of the world seems to be directly opposed to that of the ancient atomists. For them, the whole of matter is discontinuous, existing in indivisible units or atoms, each of which is a plenum—that is, a unit of matter absolutely continuous without void in it—but between which there is void or empty space. For Aristotle, the material world as a whole is a plenum, *i.e.*, continuous body without void. Hence if by "space" is meant not place but void—a bodyless interval between or within bodies—there is no space. Aristotle considers the arguments of Democritus that without void local motion would be impossible, but he thinks "there is no necessity for there being a void if there is movement."

Following Democritus, Lucretius gives another reason for positing void or empty space. As the indivisibility of the simple bodies or atoms consists in their absolute solidity—their lack of void—so the divisibility of composite bodies derives from their being constituted by both atoms and void. "Wherever space lies empty, which we call the void," Lucretius writes, "body is not there; moreover wherever body has its station, there is by no means empty void. Therefore the first bodies are solid and free from void. . . . If there were nothing which was empty and void, the whole would be solid; unless . . . there were bodies determined, to fill all the places that they held, the whole universe would be but empty void space."

For Aristotle, in contrast, the divisibility of matter seems to depend upon its being continuous. On his view, the composite body, constituted by atoms separated from one another by void, is not divisible, but is already actually divided; whereas the very thing which Lucretius regards as indivisible because it is continuous—the voidless atom—is for Aristotle divisible. To call an atom divisible is, of course,

to deny that it is atomic or, in the language of Lucretius, an uncuttable bit of "solid singleness."

Thus diametrically opposite theories of space and place seem to be connected with opposite theories of matter or body. Space as the empty interval or void *between* solid bodies goes along with atomism, whereas place as "the boundary of the containing body at which it is in contact with the contained body" goes along with the theory of the world as a material plenum.

The atomic theory and the plenum theory are opposed in one other fundamental respect concerning space. According to Aristotle, the impossibility of an actually infinite body makes the largest place finite. According to Lucretius, the infinite number of atoms requires an infinite space. Asking whether "the void that we have discovered, or room or space . . . is altogether bounded or spreads out limitless and immeasurably deep," Lucretius answers that "the whole universe is bounded in no direction." His argument seems to be like Aristotle's for an "unbounded universe." Since there can be "nothing outside the whole sum," he writes, "it lacks therefore bound or limit." But where Aristotle's meaning seems to be that the universe has no place, since all places are inside it, Lucretius appears to mean that empty space extends infinitely in all directions.

MODERN ATOMISTS like Newton and Locke hold a theory of space which accords with the view of matter existing in discontinuous units, separated by intervals of emptiness. Newton's distinction, for example, between absolute and relative space acknowledges a space that is relative to bodies, but also affirms an absolutely independent space, which has being in separation from matter or bodies. "Absolute space, in its own nature, without relation to anything external," he writes, "remains always similar and immovable. Relative space is some movable dimension or measure of the absolute spaces, which our senses determine by its position to bodies and which is commonly taken for immovable space." As for place in distinction from space, Newton holds that it is "a part of space which a body takes up, and is according to the space, either absolute or relative." In opposing Aristotle's view, he adds that place is

"not the situation, nor the external surface of the body. For the places of equal solids are always equal; but their surfaces, by reason of their dissimilar figures, are often unequal."

Locke also distinguishes between space and place, the one consisting in "the relation of distance between any two bodies or points," the other in "the relation of distance betwixt any thing and any two or more points which are considered as keeping the same distance one with another and, so considered, as at rest." With this conception of place, he holds in apparent agreement with Aristotle that "we can have no idea of the place of the universe, though we can of all the parts of it." Yet he goes on to say that what lies beyond the universe is "one uniform space or expansion, wherein the mind finds no variety or marks."

This seems to indicate that Locke's idea of space, like that of Lucretius, conceives an infinite void. "Those who assert the impossibility of space existing without matter must," he writes, "make body infinite." Furthermore, "those who dispute for or against a vacuum, do thereby confess that they have distinct ideas of vacuum and plenum, *i.e.*, that they have an idea of extension void of solidity, though they deny its existence, or else they dispute about nothing at all. For they who so much alter the signification of words, as to call extension, body, and consequently make the whole essence of body to be nothing but pure extension, must talk absurdly whenever they speak of vacuum, since it is impossible for extension to be without extension: for vacuum, whether we affirm or deny it, signifies space without body, whose very existence no one can deny to be possible who will not make matter infinite, and take from God a power to annihilate any particle of it."

Precisely because he thinks no one can affirm an infinite body, and because he conceives space to be a void, distinct from bodies, Locke finds it necessary to affirm the infinity of space. "I would ask," he says, "whether if God placed a man at the extremity of corporeal beings, he could not stretch his hand beyond his body. If he could, then he would put his arm where there was before space without body." Furthermore, if "it be impossible for any particle of matter to move but into empty space, the same possibility of a body's moving into a void space, be-

yond the utmost bounds of body, as well as into a void space interspersed amongst bodies, will always remain clear and evident. . . . So that, wherever the mind places itself by any thought, either amongst or remote from all bodies, it can, in this uniform idea of space, nowhere find any bounds, any end; and so must necessarily conclude it . . . to be actually infinite."

IT MAY SEEM PARADOXICAL that pure space—space existing without matter—is denied by one who also denies the existence of matter. "When I speak of pure or empty space," Berkeley writes, "it is not to be supposed that the word 'space' stands for an idea distinct from or conceivable without body or motion." What is meant, he suggests, is merely that the resistance one body gives to another in motion is absent when space is relatively empty. But this is always relative. "In proportion as the resistance is lesser or greater," Berkeley says, "the space is more or less *pure*." There would be absolutely pure space only if all bodies other than his own were annihilated. "If that, too, were annihilated," Berkeley concludes, "then there could be no motion, and consequently no Space."

All these contradictions concerning space enter into Kant's statement of the first cosmological antinomy, in which the thesis that the world is limited with regard to space and the antithesis that the world is infinite in space seem to be equally susceptible to proof—and so to disproof! Both alternatives violate our empirical concepts.

If space "is *infinite* and unlimited," Kant writes, "it is *too large* for every possible empirical concept. If it is *finite* and limited, you have a perfect right to ask what determines that limit. Empty space is not an independent correlate of things, and cannot be a final condition, still less an empirical condition forming part of possible experience—for how can there be experience of what is absolutely void? But in order to produce an absolute totality in an empirical synthesis, it is always requisite that the unconditioned should be an empirical concept. Thus it follows that a *limited world* would be *too small* for your concept."

Space itself, however, is for Kant "not an empirical concept which has been derived from external experience." Rather it "is a necessary

representation *a priori* forming the very foundation of all external intuitions" and, as Kant explains in his *Prolegomena*, it establishes geometry as an *a priori* science. "Space is nothing but the form of all phenomena of the external senses; it is the subjective condition of our sensibility, without which no external intuition is possible for us. . . . Nothing which is seen in space is a thing by itself," nor is "space a form of things supposed to belong to them by themselves." The external objects which we perceive in space "are nothing but representations of our senses, the form of which is space."

So far as the experience of space is concerned, William James seems to take an opposite view. Time and space relations, he says, "are impressed from without" and "*stamp copies of themselves within*." To the Kantian theory that space is "a *quality produced* out of the inward resources of the mind, to envelope sensations which, as given originally, are not spatial," James replies that he can find "no introspective experience of mentally producing or creating space."

He proposes two other alternatives: "either (1) there is no spatial *quality* of sensation at all, and space is a mere symbol of succession; or (2) there is an *extensive quality given immediately* in certain particular sensations." The second seems to James best suited to explain the development of our perceptions of space, and he does not think it inconsistent with the *a priori* or non-empirical character of geometry, whose necessary truths refer to ideal objects, not to experienced things in physical space.

THE CHAPTER ON MATHEMATICS considers the relation of the postulates of diverse geometries to the diversity of Euclidean and non-Euclidean spaces, such as that of the flat plane, the surface of a sphere, and the surface of a pseudosphere. Just as different parallel postulates select different spaces for geometrical construction, so a postulate like Euclid's concerning the equality of all right angles seems to assume a uniformity of space which permits geometrical figures to be transposed without alteration. "If translation through space warped or magnified forms," James remarks, "then the relations of equality, etc., would always have to be expressed with a position-qualification added."

Confronted with a variety of purely mathematical spaces, the physicist is concerned with the problem of which geometry is, as Einstein says, in "correspondence with a 'real' object," or true of the real world. "According to the general theory of relativity, the geometrical properties of space are not independent," Einstein writes, "but are determined by matter." It follows that our assumptions about the distribution of matter determine the character of the world's space.

On the assumption of a world "not inhabited by matter everywhere," in whose infinite space "the average density of matter would necessarily be *nil*," Einstein says we can imagine "a quasi-Euclidean universe" analogous to "a surface which is irregularly curved in its individual parts, but which nowhere departs appreciably from a plane: something like the rippled surface of a lake." But if the "average density of matter . . . differs from zero, however small may be that difference, then the universe cannot be quasi-Euclidean." It would be spherical (or elliptical) if the matter were uniformly distributed; but "since in reality the detailed distribution of matter is not uniform," Einstein concludes that "the real universe will deviate in individual parts from the spherical, *i.e.*, the universe will be quasi-spherical. But it will be necessarily finite."

The nature of the actual space of the universe thus seems to be related to the issue whether physical as opposed to mathematical space is a void or filled with matter. Defining a vacuum as "a space empty of all bodies known to the senses," Pascal insists that "there is as much difference between nothingness and space, as there is between empty space and a material body," so that "empty space occupies the mean between matter and nothingness." Torricelli's experiments seem to him complete proof against the disciples of Aristotle, for they upset the belief that "nature abhors a vacuum."

Gilbert's observations on magnetic influences, Newton's observations on the transmission of light and heat as well as gravitational pull, and Faraday's on electrical phenomena, all seem to admit the possibility of action at a distance, or through a vacuum. But the question remains whether the so-called physical vacuum

is an absolute void or merely empty of "all bodies known to the senses."

"Is not the heat of the warm room conveyed through the *vacuum*," Newton asks, "by the vibrations of a much subtler medium than air which after the air was drawn out remained in the *vacuum*? And is not this medium the same with that medium by which light is refracted and reflected, and by whose vibrations light communicates heat to bodies? . . . And is not this medium exceedingly more rare and subtle than the air, and exceedingly more elastic and active? And does it not readily pervade all bodies? And is it not (by its elastic force) expanded through all the heavens?"

Huygens also refers to an ethereal matter as the medium for the propagation of light. "One will see," he writes, "that it is not the same that serves for the propagation of sound . . . It is not the same air, but another kind of matter in which light spreads; since if the air is removed from the vessel, the light does not cease to traverse it as before." But this ethereal medium, without which bodies would act at a distance upon one another—gravitationally, magnetically, electrically—through an absolute void, seems to have contrary properties. It is not only "subtler" than air, but, as Newton suggests, it may be "denser than quick-silver or gold," since "planets and comets, and all gross bodies perform their motions more freely, and with less resistance in this aethereal medium than in any fluid, which fills all space adequately without leaving any pores." And, in still another place, he asks: "What is there in places almost empty of matter, and whence is it that the Sun and Planets gravitate towards one another, without dense matter between them?"

Whatever may be thought of the ether as a physical hypothesis, the problem still remains whether action can take place at a distance through a void or must employ what Faraday calls "*physical* lines of force" through filled space. Faraday thinks the evidences support the latter alternative for both electricity and magnetism. He quotes a letter from Newton to Bentley to show that Newton was "an unhesitating believer in physical lines of gravitating force."

In that letter, posthumously discovered, Newton says: "That gravity should be innate, in-

herent and essential to matter, so that one body may act upon another at a distance through a *vacuum*, without the mediation of anything else, by and through which their action and

force may be conveyed from one to another, is to me so great an absurdity, that I believe no man who has in philosophical matters a competent faculty of thinking, can ever fall into it "

OUTLINE OF TOPICS

PAGE

1. Space, place, and matter

819

1*a* Space or extension as the essence or property of bodies space, the receptacle, and becoming

1*b*. Place as the envelope or container of bodies place as a part of space or as relative position in space

1*c* The tridimensionality of bodies the indeterminate dimensions of pure space or prime matter

820

1*d* The exclusiveness of bodily occupation of space impenetrability

2 Space, void, and motion

2*a* The role of space or place in local motion the theory of proper places, absolute and relative space

2*b* The issue of the void or vacuum

821

(1) The distinction between empty and filled space

(2) The indispensability of void or vacuum for motion and division the absence of void in atoms

(3) The denial of void or vacuum in favor of a plenum

2*c* Space as a medium of physical action the ether and action at a distance, the phenomena of gravitation, radiation, and electricity

3 Space, quantity, and relation

822

3*a*. The finitude or infinity of space, the continuity and divisibility of space

3*b* The relation of physical and mathematical space, sensible and ideal space

3*c* Geometrical space, its kinds and properties spatial relationships and configurations

3*d* The measurement of spaces, distances, and sizes, trigonometry, the use of parallels

823

4 The knowledge of space and figures

4*a* Space as the divine sensorium and space as a transcendental form of intuition: the *a priori* foundations of geometry

4*b*. The controversy concerning innate and acquired space-perception

4*c*. The perception of space differences between visual, auditory, and tactual space; perspective and spatial illusions

5. The mode of existence of geometrical objects, their character as abstractions; their relation to intelligible matter

6 The spiritual significance of place, position, and space

824

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45--(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 90: STATE

INTRODUCTION

IS man gregarious in the same sense as other animals are? Is he, unlike other social animals, the only political animal? Does man pattern the state after his own nature, or does he, in imitation of the angels, try to live up to a "city in the skies"—a model of rationality or a utopian illusion? According to the way such questions are answered, different theories of the state develop in the tradition of western thought.

But it is not only the view man takes of his social nature which affects his view of society or the state. His conception of the state is also colored by his understanding of man's place in nature and by his understanding of man's relation to God. On one view the state is ordered to the service of man; on another, man is thought to be a creature of the state, and the state is made God; on still another, man—like Antigone in Sophocles' play—seems to be torn between serving the state and serving God.

If man admits anything to be his superior, he acknowledges his inferiority only to God or to the state. That the idea of God and the idea of the state compete for maximum attention in the tradition of western thought is a significant and readily intelligible fact. That the word "sovereign," which connotes *absolute supremacy*, has both political and religious significance throws further light on this rivalry. It immediately suggests all the issues of church and state, of the spiritual and the temporal power, of the city of God and the city of man.

Even without the aura of divinity, the state, in the conception of many writers, assumes by comparison with the individual man the proportions of the greatest living thing on earth. For Plato it is the counterpart of the human soul, many times magnified. For Aristotle it is like an organic whole to which the individual belongs, just as his own arm or leg belongs to

him as an organic part. For Hobbes it is the body politic—that Leviathan which dwarfs its members. For Rousseau it is the corporate person, having a general will more perfect than the individual will—infallible, or almost infallible. When to these images of the state is added the highest transfiguration—that by which the state becomes, according to Hegel, the image of God on earth or the embodiment of Absolute Spirit—the greatness of the state cannot be magnified further.

THE PASSAGES IN WHICH these conceptions first appear are among the most famous in the literature of the theory of the state. In the *Republic*, Socrates proposes that "we inquire into the nature of justice and injustice, first as they appear in the State and secondly in the individual, proceeding from the greater to the lesser and comparing them." After the structure of the state has been examined in terms of its constituent classes and their functions or relations to one another, Socrates returns to the individual. We may assume, he says, that "he has the same three principles in his own soul which are found in the state"; and in another place he adds that "there appear to be as many forms of the soul as there are distinct forms of the State."

Whereas Plato analogizes the social classes in the state with the parts of the soul, Aristotle compares the state in relation to the individual with the body in relation to its members. "The state is by nature clearly prior to the family and to the individual," Aristotle writes, "since the whole is of necessity prior to the part; for example, if the whole body be destroyed, there will be no foot or hand, except in an equivocal sense. . . . The proof that the state is a creation of nature and prior to the individual is that the individual, when isolated, is not self-sufficing;

and therefore he is like a part in relation to the whole."

The analogical conception of the state takes a different turn with Hobbes. The state is a work of art, not a creation of nature. "Nature (the Art whereby God hath made and governs the world)," says Hobbes, "is by the Art of man, as in many other things, so in this also, imitated that it can make an Artificial Animal." The machines men make—"engines that move themselves by springs and wheels as doth a watch"—seem to Hobbes to "have an artificial life." But "Art goes yet further, imitating that Rational and most excellent work of Nature, Man. For by Art is created that great Leviathan called a Commonwealth or State (in Latin *Civitas*) which is but an Artificial Man; though of greater stature and strength than the Natural, for whose protection and defense it was intended; and in which the Sovereignty is an Artificial Soul, as giving life and motion to the whole body."

Hobbes also speaks of the multitude being "united in one Person" as the "generation of that great Leviathan, or rather (to speak more reverently) of that Mortal God, to which we owe under the Immortal God, our peace and defence." It is both divine and human, for "that which is compounded of the powers of most men, united by consent in one person, natural or civil" is, according to Hobbes, "the greatest of human powers."

Rousseau has a number of different names for the "moral and collective body" formed by the association of individuals. "This public person," he says, "formerly took the name *city*, and now takes that of *Republic* or *body politic*; it is called by its members *State* when passive, *Sovereign* when active, and *Power* when compared with others like itself." But Rousseau's primary emphasis seems to be upon the personality of the State; it is a corporate person, with moral qualities and intellectual faculties. He refers repeatedly to the State "as a *persona ficta*" and as "a moral person whose life is in the union of its members."

Many of these comparisons or analogies recur in Hegel's theory of the state. But for Hegel they are no longer metaphors, they are the elements of a literal definition. "The state is an organism," says Hegel. It is the organic whole

no part of which can have a separate life. As "occurs with life in the physical organism," he writes, "life is present in every cell" and "separated from that life, every cell dies. This is the same as the ideality of every single class, power, and Corporation as soon as they have the impulse to subsist and be independent. It is with them as with the belly in the organism. It, too, asserts its independence, but at the same time its independence is set aside and it is sacrificed and absorbed into the whole."

But the state is not merely a living organism. "To the mature state," says Hegel, "thought and consciousness essentially belong. . . . As high as mind stands above nature, so high does the state stand above physical life. Man must therefore venerate the state as the divine on earth, and observe that if it is difficult to comprehend nature, it is infinitely harder to understand the state." In saying this Hegel seems to go beyond analogy to the assertion of a definition. "The march of God in the world, that is what the state is," he declares. "The basis of the state is the power of the reason actualizing itself as will. In considering the Idea of the state, we must not have our eyes on particular states or on particular institutions. Instead we must consider the Idea, this actual God, by itself."

To those who object that the state is finite, Hegel replies that "to hold that mind on earth, *i.e.*, the state, is only a finite mind, is a one-sided view, since there is nothing irrational about actuality. Of course, a bad state is worldly and finite and nothing else. But the rational state is inherently infinite." As simply stated by Hegel in the Introduction to his *Philosophy of History*, "the State is the Divine idea as it exists on Earth."

THE DIVERSE CONCEPTIONS of the state raise major issues in political theory concerning the origin of the state and the ends it serves, in both of which is involved the problem of the individual's relation to the state. That problem is touched on in the chapter on CITIZEN, and wherever the problem of the common good or the general welfare is discussed. Here the question whether the state is made for man or man for the state, whether the state subordinates the individual in every phase of his life or only in those matters wherein the public welfare

takes precedence over private interests, serves critically to test the practical significance of different theories of the state. Here also questions concerning the relation of the family to the state—discussed from the point of view of the domestic community in the chapter on FAMILY—throw light on the nature and origin of the political community.

The word "community" and its synonym "society" seem to be more inclusive in meaning than "state." The family and the state are both communities—associations of individuals for a common purpose and sharing in a common life. The word "state" is customarily used only for the developed political society—whether a city-state, a feudal state, or a nation state; the word "society" usually covers the tribal community, the village, or any community which is politically primitive and has some of the characteristics of a large family. In addition there are within the state, at least in its modern formation, many organized groups which deserve the name "society"—economic corporations and other associations, religious, educational, professional, recreational; and more comprehensive than any particular political community are the cities of God and man which, in Augustine's conception of them, are not to be identified with either the Church or the State.

With the rise of the science of sociology in our time, the idea of society has come to be regarded as more general than that of state. But in the tradition of the great books, particularly those of political theory, the state seems to be considered the epitome of human society. All other forms of association are, for the most part, discussed only in their relation to the state, either as the antecedents from which the state develops, or as the subordinate organizations which it includes, or sometimes, as in the case of the church, a distinct but coordinate community.

The nature of society in general and the problem of different types of social organization and development are not treated in the great books except in their bearing on the family, the church, or the state—the three communities which seem to be taken as representative or basic. Hence there is no chapter on society or community as such. What for modern

sociology is a unified subject matter here divides into a number of related yet distinct ideas—the domestic community being treated in the chapter on FAMILY, the religious community in the chapter on RELIGION, the various forms of economic organization in the chapters on LABOR and WEALTH. In this chapter, therefore, we shall confine our attention to the specifically political community, both in itself and in relation to these other communities or social groups.

CONCEIVED IN POLITICAL terms, the problems of the state would seem to be inseparable from the problems of government. Yet the ideas of state and government may be separated to the extent that one signifies the political community as a whole and the other the organization of its members according to relationships of ruler and ruled. Furthermore, the state may in one sense remain the same while in another it changes with changes in its form of government.

Some writers, like Aristotle and Hegel, tend to identify state and government. Aristotle, for example, says that "the sameness of the state consists chiefly in the sameness of its constitution." Others, like Locke and Rousseau, seem to regard government as part of the state, the chief institution of a civil society or political community, but definitely a means for securing the ends for which the state is formed. For Locke government is primarily the legislative power, for Rousseau it is "the supreme administration, the legitimate exercise of the executive power," but for both it is a representative body—an organ of the whole body politic.

Insofar as the great political theorists distinguish problems of the external relation of states with one another from those which concern the internal organization of the state, and the relation of the state to its own members, they also tend to distinguish state from government. Hegel's distinction between external and internal sovereignty, for example, conceives the whole community as a sovereign state in relation to other communities and the state as a sovereign government in relation to its own members.

Such questions of sovereignty, or more generally of the relation of states to one another, belong to this chapter as well as to the chapter

on WAR AND PEACE; but the theory of government is for the most part treated elsewhere—in the chapters on GOVERNMENT and CONSTITUTION, and in all the chapters dealing with the special forms of government. Still other problems of government, which have a bearing on the nature of the state, its powers, and its limits, are dealt with in the chapters on JUSTICE and LAW.

THAT IT IS SOMEHOW natural for men to associate politically is generally affirmed, even by those who also think the state is artificial or conventional. No one takes either of the possible extreme positions: that the state as a purely voluntary association is without any basis at all in man's nature and needs; or that the state, like the bee hive and the ant mound, is purely a production of instinct.

Saying that "man is by nature a political animal," Aristotle goes on to remark that "man is more of a political animal than bees or other gregarious animals." But the difference Aristotle points out between man and other social animals may make man the *only* political animal. It consists in the fact that man, being "the only animal . . . endowed with the gift of speech," can communicate with his fellows concerning "the expedient and inexpedient, and therefore likewise the just and the unjust." What characterizes human associations, according to Aristotle, is that they are built upon a shared sense of the expedient and the just. "Justice," he writes, "is the bond of men in states."

Hobbes also distinguishes between human and animal societies, but seems to interpret the distinction differently. "Bees and ants live sociably one with another," he says, "and yet have no other direction than their particular judgments and appetites; nor speech, whereby one of them can signify to another what he thinks expedient for the common benefit." Inquiring "why mankind cannot do the same"—that is, live sociably without government and law—Hobbes offers a number of explanations, of which the last is that "the agreement of these creatures is natural; that of men is by covenant only, which is artificial; and therefore it is no wonder if there be somewhat else required (besides covenant) to make their agreement constant and lasting, which is common power to keep them in awe

and to direct their actions to the common benefit."

But though Hobbes calls the state artificial because he holds it to be the product of a contract, he does not deny the natural necessity which drives men to the creation of a commonwealth. Man quits the state of nature, which is a "war of every man against every man," to achieve self-preservation, or at least to enjoy the security of civil peace and the freedom from fear of violence.

As natural as it may be for men to be "in that condition which is called war" when "they live without a common power to keep them all in awe," it is equally natural, according to Hobbes, for men to seek peace. "The passions that incline men to peace are fear of death, desire of such things as are necessary to commodious living; and a hope by their industry to obtain them. And reason suggesteth convenient articles of peace, upon which men may be drawn to agreement." The commonwealth is therefore natural, to the extent that man's needs and passions require it and man's reason recognizes certain natural laws for constructing it.

The state is naturally necessary, not as the effect of instinctive determinations, but as the rationally determined means to an end. If the end the state serves were not naturally sought, or if there were any other means which reason could devise for accomplishing that end, the state would be purely conventional—and dispensable. "The final cause, end, or design of men in the introduction of that restraint upon themselves (in which we see them live in commonwealths) is," according to Hobbes, "the sight of their own preservation and of a more contented life thereby."

In this main particular Aristotle's account of the origin of the state seems to be the same. Though he does not attribute its formation to a contract, and does not make fear the predominant motive, he does regard the state as natural *only because* of its indispensability as a means for achieving the ends men naturally seek. The family is natural, Aristotle suggests, because it is necessary for the perpetuation of the race and "for the supply of men's everyday wants." When men aim "at something more than the supply of daily needs, the first society

to be formed is the village"—normally, an association of families. And "when several villages are united in a single complete community, large enough to be nearly or quite self-sufficing, the state comes into existence, originating in the bare needs of life, and continuing in existence for the sake of a good life. Therefore, if the earlier forms of society are natural, so is the state."

The implication seems to be that if men were not naturally impelled to seek a better life than the family or the tribal community can provide—in other words, if the family or village satisfied all of man's natural needs for society—the larger community, the state, would be neither natural nor necessary. That man is by nature a political animal does not, therefore, mean that men have always and everywhere lived in states.

Aristotle refers to the man who lives apart from society, describing the natural outcast—"the 'tribeless, lawless, heartless one' whom Homer denounces"—as "a lover of war." He conceives the state as coming into being subsequent to more primitive forms of social life, each type of community being successively "established with a view to some good, for mankind always act in order to obtain that which they think good." Since he thinks that the state "aims at good in a greater degree than any other, and at the highest good," he praises the man "who first founded the state" as "the greatest of benefactors."

FOR ARISTOTLE, THEN, there seems to be no inconsistency in saying that the state is as natural as the family and also that it is the result of a convention, *i.e.*, a voluntary association of men. Nor does there seem to be any inconsistency between Hobbes' view that the state is produced by a "covenant of every man with every man" and his understanding of the naturalness of the state in terms of the impulses which lead men to enter into this contract. The same double note appears in the account of the state's origin which Locke, Rousseau, and Kant give. The issue raised by the contract theory thus seems to turn on the interpretation of the original convention—whether or not it has legal significance and what obligations or limitations it imposes.

Where Hobbes, for example, interprets the contract as creating, along with the common-

wealth, a sovereign person having absolute power, Locke seems to make majority rule the legal consequence of the original compact. God "designed man for a sociable creature," according to Locke, "with an inclination and under a necessity to have fellowship with those of his own kind." Yet even what he calls "the first society . . . between man and wife," Locke says, "is made by a voluntary compact." It makes no difference to Locke's theory whether political societies develop by expansion from the family (which he takes to be the normal course of events) or result from a voluntary association of independent men.

In either case, political as distinguished from domestic society does not begin until "every man, by consenting with others to make one body politic under one government, puts himself under an obligation to every one of that society, to submit to the determination of the majority. . . . This is done by barely agreeing to unite into one political society, which is all the compact that is, or needs be, between the individuals that enter into or make up a commonwealth. And thus that which begins and actually constitutes any political society is nothing but the consent of any number of free men capable of a majority to unite and incorporate into such a society."

If it is "that, and that only, which did or could give beginning to any lawful government in the world," it seems to be equally evident to Locke that "absolute monarchy, which by some men is counted the only government in the world, is indeed inconsistent with civil society, and so can be no form of civil government at all."

Though Rousseau says that the most ancient of all societies, the family, is "the only one that is natural," he qualifies this by adding that it remains natural only so long as the children need the family for their preservation. If the members of the family remain united thereafter, "they continue so no longer naturally, but voluntarily; and the family itself is then maintained only by convention." By the same criterion, civil society would seem to be natural, at least on Rousseau's own supposition that "the obstacles in the way of their preservation in the state of nature" are greater than the power of isolated individuals or families to maintain

themselves, and so "the human race would perish unless it changed its manner of existence."

Rousseau, furthermore, explicitly denies that the transition from a state of nature to a state of civil society can be treated as an historical fact. It is an hypothesis "calculated to explain the nature of things, [rather] than to ascertain their actual origin." The social contract, which Rousseau sometimes calls the "first convention," is, therefore, the legal, not the historical, origin of the state. As he formulates the compact, "each of us puts his person and all his power in common under the supreme direction of the general will, and, in our corporate capacity, we receive each member as an indivisible part of the whole."

Though "all the qualities of the general will" may "reside in the majority," so that the general will can be discovered by a majority vote, unanimity is required to create the sovereign body politic, with the right as well as the power to compel "whoever refuses to obey the general will." Rousseau points out that "the law of majority voting is itself something established by convention, and presupposes unanimity, on one occasion at least." To this extent Rousseau agrees with Locke about the juridical significance of the original convention or the universal consent which establishes a civil society; and just as Locke calls absolute monarchy inconsistent with the very nature of the state, so Rousseau uses the words "republic" and "body politic" interchangeably. "To be legitimate," he writes, "the government must be, not one with the sovereign, but its minister."

But Rousseau identifies government with the executive, rather than primarily with the legislative as Locke does. He therefore denies that the original convention institutes government as well as the body politic itself—"the Sovereign having no force other than the legislative power." In consequence, Rousseau and Locke differ somewhat in their discussion of the dissolution of government as distinguished from the dissolution of society, or the death of the body politic. Rousseau regards no law as irrevocable, "not excluding the social compact itself; for if all the citizens assembled of one accord to break the compact, it is impossible to doubt that it would be very legitimately broken."

According to Kant, "a state is the union of a number of men under juridical laws"—the opposite of the state of nature, "in which there is no distributive justice." It is incumbent on men, says Kant, "to accept the principle that it is necessary to leave the state of nature, in which every one follows his own inclinations, and to form a union of all those who cannot avoid coming into reciprocal communication, and thus subject themselves in common to the external restraint of public compulsory laws."

Kant refers to this principle as the "postulate of public right" which obliges "all men to enter into the relations of a civil state of society." The state thus seems to be both necessary and voluntary; for though he says that "the act by which a people is represented as constituting itself into a state is termed *the original contract*," yet he also adds that "this is properly only an outward mode of representing the idea by which the rightfulness of the process of organizing the constitution may be made conceivable."

AGAINST ALL THESE notions of the original contract, Hegel, criticizing Kant's treatment of marriage under the concept of contract, says that "it is equally far from the truth to ground the nature of the state on the contractual relation, whether the state is supposed to be a contract of all with all, or of all with the monarch and the government." Contract, according to Hegel, belongs to the sphere of "relationships concerning private property generally." Hence "the intrusion of this contractual relation . . . into the relation between the individual and the state has been productive of the greatest confusion in both constitutional law and public life."

A contract, Hegel explains, "springs from a person's arbitrary will, an origin which marriage too has in common with contract. But the case is quite different with the state; it does not lie with an individual's arbitrary will to separate himself from the state, because we are already citizens of the state by birth. The rational end of man is life in the state, and if there is no state there, reason at once demands that one be founded. Permission to enter a state or leave it must be given by the state; this then is not a matter which depends on an individual's ar-

bitrary will and therefore the state does not rest on contract, for contract presupposes arbitrariness. It is false to maintain that the foundation of the state is something at the option of all its members. It is nearer the truth to say that it is absolutely necessary for every individual to be a citizen."

Hegel dismisses all questions concerning historical origins in general or particular as "no concern of the Idea of the state." In the Idea itself, its antecedents are to be found. The family and civil society are the earlier—logical—moments in the development of the Idea of the State. "Civil society," Hegel writes, "is the [state of] difference which intervenes between the family and the state, even if its formation follows later in time than that of the state." The social contract theory applies only to what he calls "civil society," by which he means the modern conception of the state "as a unity which is only a partnership. . . . Many modern constitutional lawyers," Hegel goes on, "have been able to bring within their purview no theory of the state but this. In civil society each member is his own end" and, "except by contract with others, he cannot attain the whole compass of his ends, and therefore these others are means to the end of the particular members."

In another place, Hegel describes civil society as a system of complete interdependence for the attainment of selfish ends, "wherein the livelihood, happiness, and legal status of one man is interwoven with the livelihood, happiness, and rights of all." In still another, he observes that only when the state is confused with civil society, only when "its specific end is laid down as the security and protection of property and personal freedom," does "the interest of the individuals as such become the ultimate end of their association." Whence "it follows that membership in the state is something optional. But the state's relation to the individual is quite different from this. Since the state is mind objectified, it is only as one of its members that the individual himself has objectivity, genuine individuality, and an ethical life."

The unity of the state, unlike that of civil society, is, according to Hegel, "an absolute unmoved end in itself, in which freedom comes into its supreme right. . . . This final end has

supreme right against the individual, whose supreme duty is to be a member of the state."

IT DOES NOT SEEM to be an inevitable corollary of the social contract theory that the state be conceived as serving the private interests of individuals. "The welfare of the state," Kant declares, "is its own highest good." It is not to be understood merely as "the individual *well-being* and *happiness* of the citizens of the state; for—as Rousseau asserts—this end may perhaps be more agreeably and more desirably attained in the state of nature." Kant and Locke both affirm a social contract, but where Kant makes the safety of the republic itself the highest law (*salus reipublicae suprema lex*), Locke makes it the security of the people (*salus populi*).

"The reason why men enter into society is the preservation of their property," writes Locke. The property of the individual is insecure in a state of nature; to avoid this insecurity "men unite into societies that they may have the united strength of the whole society to secure and defend their properties." When Locke says that the chief end of civil society is "the preservation of property," he does not refer solely to economic goods, but to all the goods to which he thinks man has a natural right—"his life, liberty, and estate." Men would not quit the state of nature, he writes, "were it not to preserve their lives, liberties and fortunes, and by stated rules of right and property to secure their peace and quiet."

In the light of Locke's conception of "property," his position resembles Hobbes' statement of the end which men seek in forming a commonwealth: "to live peaceably amongst themselves and be protected against other men" and to get "themselves out from that miserable condition of war" in which life is "solitary, poor, nasty, brutish, and short."

It seems to be in a different sense of property that Rousseau holds that "the foundation of the social compact is property; and its first condition, that everyone should be maintained in the peaceful possession of what belongs to him." Restricting "property" to economic possessions, Rousseau asks, "Are not all the advantages of society for the rich and powerful?" Society, he observes, "provides a powerful protection for the immense possessions of the rich,

and hardly leaves the poor man in quiet possession of the cottage he builds with his own hands."

This and Adam Smith's statement that "civil government, so far as it is instituted for the security of property, is in reality instituted for the defence of the rich against the poor, or of those who have some property against those who have none at all," seem to anticipate the Marxist view of the state as the bulwark of property rights and an instrument of class oppression. If the protection of property and the maintenance of economic inequalities is the sole purpose of the state, then the ultimate resolution of the class war in favor of a classless society will, in the opinion of Marx and Engels, be accompanied by what they call "the withering away of the state"—an atrophy from loss of function.

But even in a classless society, the state would not cease to function if its end were to secure not merely the individual's wealth, but his whole well-being. Then, however, we must face another question—whether the happiness of the individual is the end of the state. Plato, for example, seems to answer this question in opposite ways.

In the *Protagoras*, it is said that "the desire for self-preservation gathered men into cities." This is part of the Promethean legend of the origin of civilization. As told by Aeschylus—and in a similar account of early history by Lucretius—the story intimates that men contract to live together for protection against violence and to enjoy a better life—the fruits of civil society or civilization.

But in the *Republic*, Socrates says that, in constructing the ideal state, the aim is "not the disproportionate happiness of any one class, but the greatest happiness of the whole." To the objection of Adeimantus that the citizens may be miserable in such a state, Socrates replies that we must consider whether "we would look to their greatest happiness individually, or whether this principle of happiness does not rather reside in the State as a whole." Later Socrates reminds Glaucon, who wonders whether the members of the guardian (or ruling) class will not be unhappy, that we are "fashioning the State with a view to the greatest happiness, not of any particular class, but of the whole."

Aristotle criticizes Socrates for depriving even the guardians of happiness and for saying that "the legislator ought to make the whole state happy." In his own view, "the whole cannot be happy unless most, or all, or some of its parts enjoy happiness. In this respect, happiness is not like the even principle in numbers, which may exist only in the whole, but in neither of the parts." When Aristotle asserts that "the state exists for the sake of a good life," he seems to have the happiness of individuals in mind, for he excludes slaves and brute animals from membership in the state on the ground that they can have "no share in happiness or in a life of free choice."

But Aristotle also seems to give the state pre-eminence over the individual. "Even if the end is the same for a single man and for a state," he writes, "that of the state seems at all events something greater and more complete, whether to attain or to preserve." This does not seem to him inconsistent with thinking that that "form of government is best in which every man, whoever he is, can act best and live happily."

Nor is Hegel reluctant to embrace both horns of the dilemma. Civil society rather than the state in its perfect realization seems to be devoted to the "attainment of selfish ends," such as individual happiness. But Hegel also says it is "perfectly true" that "the end of the state is the happiness of the citizens. . . . If all is not well with them, if their subjective aims are not satisfied, if they do not find that the state as such is the means to their satisfaction, then the footing of the state is itself insecure."

THE FOREGOING CONSIDERATIONS of the nature, origin, and end of political society enter into the various conceptions of the ideal state which appear in the tradition of western thought. They also have a bearing on the division of social classes in the state, on the duties of the statesman or prince, and the principles of statecraft—the art or science of the ruler. Finally, they have implications for the relation of states to one another and for the different historic formations of the state.

All the modern writers who make some distinction between the state of nature and the state of civil society seem to agree that independent or sovereign states in their relation to

one another are in a state of nature. Identifying the state of nature with the state of war, Hobbes remarks that "though there had never been any time, wherein particular men were in a condition of war one against another, yet in all times, kings and persons of sovereign authority" are "in the state and posture of gladiators . . . which is the posture of war."

Similarly, to the question, "Where are or ever were there any men in a state of nature?" Locke replies, "all princes and rulers of independent governments all through the world are in a state of nature." Because "bodies politic" remain "in a state of nature among themselves," they experience, according to Rousseau, "all the inconveniences which had obliged individuals to forsake it." With the same intent, Montesquieu observes that "princes who live not among themselves under civil law are not free; they are governed by force; they may continually force or be forced."

In Kant's opinion, "states, viewed as nations in their external relations to one another—like lawless savages—are naturally in a non-juridical condition," and he adds that "this natural condition is a state of war." Similarly, Hegel writes that "since the sovereignty of a state is the principle of its relations to others, states are to that extent in a state of nature in relation to each other."

On any of the theories concerning the origin of the state, it may be asked why political society cannot be enlarged to include all mankind. If, for example, in Aristotle's view, the state is a union of villages, as the village is a union of families, why may not a further expansion of political society be brought about by a union of states?

The question is not simply one of geographical limits or extent of population. The modern national state, though normally larger than the ancient city-state, remains an individual state and in the same external relationship to other states. Even the expansion of a city-state like Rome, at the greatest extent of its imperial domain, does not exemplify the principle of the world-state unless it is proposed that the political unification of mankind be brought about by conquest and maintained by despotism.

Though Aristotle describes the state as formed by a combination of villages, he does

not propose a combination of states to form a larger community. His reason may be that the essence of the state lies in its self-sufficiency. Consequently, "the best limit of the population of a state is the largest number which suffices for the purposes of life, and can be taken in at a single view"; and the territory need be no larger than one which enables the population to be "most entirely self-sufficing."

The moderns, in contrast, propose the expansion of the political community by the amalgamation of separate political units. Montesquieu, for example, suggests that by entering into a "confederate republic," a number of small states can obtain the security which none of them has by itself. "If a republic be small," he writes, "it is destroyed by a foreign force; if it be large, it is ruined by an internal imperfection." A confederate republic, he thinks, "has all the internal advantages of a republican, together with the external force of a monarchical government. . . . This form of government," Montesquieu continues, "is a convention by which several petty states agree to become members of a larger one, which they intend to establish. It is a kind of assemblage of societies, that constitute a new one, capable of increasing by means of further associations, till they arrive at such a degree of power as to be able to provide for the security of the whole body."

It is not security against external aggression, but internal peace, which leads Rousseau to propose an association more extensive than anything Montesquieu seems to have in mind—a confederation of *all* the states of Europe. But he does not see beyond Europe to all the states of the world. He regards "the great city of the world" as something less than a political society with civil laws, for he speaks of it as "the body politic whose general will is always the law of nature."

Nor are the American Federalists, Hamilton, Madison, and Jay, able, at the end of the 18th century, to envisage the unlimited extension of the principle of federal union. They content themselves with arguing for the possibility of so extensive a union as the projected United States of America, against those who quoted "the observations of Montesquieu on the necessity of a contracted territory for a Republican Government."

Before our own day Kant alone seems to contemplate the possibility of a world state *through federal union*. The "cosmopolitical ideal," he says, is "a universal union of states analogous to that by which a nation becomes a state." The postulate of reason which obliges men to quit the state of nature and form a civil union applies to states as well. "The natural state of nations, as well as of individual men," Kant writes, "is a state which it is a duty to pass out of, in order to enter into a legal state." But the ideal is impracticable in Kant's opinion—again because of the supposed limits of government with respect to extended territories and populations.

"With the too great extension of such a union of states over vast regions, any government of it, and consequently the protection of its individual members, must at last become impossible." Kant therefore proposes as an alternative a "permanent congress of nations," but one which, being "a voluntary combination of states . . . would be dissolvable at any time"—a mere league or confederacy, and not such a federal union "as is embodied in the United States of America, founded upon a political constitution, and therefore indissoluble."

The further implications of Kant's proposal, the alternative it replaces, and Hegel's objec-

tions to either, are discussed in the chapter on WAR AND PEACE. Here it seems appropriate to conclude with that vision of the world state which appears early in the tradition of the great books. It is conceived not as a world-wide federal union, but as a universal or unlimited community in which all men are citizens together even as they belong to one human brotherhood.

"If our intellectual part is common," argues the philosophical Roman Emperor, Marcus Aurelius, "the reason also, in respect of which we are rational beings, is common; if this is so, common also is the reason which commands us what to do, and what not to do; if this is so, there is a common law also; if this is so, we are fellow-citizens; if this is so, we are members of some political community; if this is so, the world is in a manner a state."

Centuries later Dante, in the first book of his *De Monarchia*, recaptures this ancient vision of the world state. Because "a plurality of authorities is disorder," authority must be single; and therefore, Dante argues, "world government is necessary . . . for the well-being of the world." It must be conceived as governing "mankind on the basis of what all have in common." By that "common law, it leads all toward peace."

OUTLINE OF TOPICS

	PAGE
1. The nature of human society	838
1a. Comparison of human and animal gregariousness: human and animal societies	
1b. Comparison of the family and the state in origin, structure, and government	839
1c. Associations intermediate between the family and the state: the village or tribal community; civil society as the stage between family and state	
1d. Social groups other than the family or the state: religious, charitable, educational, and economic organizations; the corporation	
2. The general theory of the state	840
2a. Definitions of the state or political community: its form and purpose	
(1) Comparison of the state and the soul: the conception of the state as a living organism; the body politic	
(2) The state as a corporate person	841
(3) The progressive realization of the state as the process of history: the state as the divine idea as it exists on earth; the national spirit	

- 2*b*. The state as a part or the whole of society
- 2*c*. The source or principle of the state's sovereignty: the sovereignty of the prince; the sovereignty of the people
- 2*d*. The economic aspect of the state: differentiation of states according to their economic systems
- 2*e*. The political structure of the state: its determination by the form of government
- 2*f*. The primacy of the state or the human person: the welfare of the state and the happiness of its members
- 2*g*. Church and state: the relation of the city of God to the city of man
- 3. The origin, preservation, and dissolution of the state
 - 3*a*. The development of the state from other communities
 - 3*b*. The state as natural or conventional or both
 - (1) Man as by nature a political animal: the human need for civil society
 - (2) Natural law and the formation of the state
 - 3*c*. The condition of man in the state of nature and in the state of civil society: the state of war in relation to the state of nature
 - 3*d*. The social contract as the origin of civil society or the state: universal consent as the basis of the constitution or government of the state
 - 3*e*. Love and justice as the bond of men in states: friendship and patriotism
 - 3*f*. Fear and dependence as the cause of social cohesion: protection and security
 - 3*g*. The identity and continuity of a state: the dissolution of the body politic or civil society
- 4. The physical foundations of society: the geographical and biological conditions of the state
 - 4*a*. The territorial extent of the state: its importance relative to different forms of government
 - 4*b*. The influence of climate and geography on political institutions and political economy
 - 4*c*. The size, diversity, and distribution of populations: the causes and effects of their increase or decrease
- 5. The social structure or stratification of the state
 - 5*a*. The political distinction between ruling and subject classes, and between citizens and denizens
 - 5*b*. The family as a member of the state: its autonomy and its subordination
 - 5*c*. The classes or sub-groups arising from the division of labor or distinctions of birth: the social hierarchy
 - 5*d*. The conflict of classes within the state
 - (1) The opposition of social groups: the treatment of national, racial, and religious minorities
 - (2) The clash of economic interests and political factions: the class war
 - 5*e*. The classless society

6. The ideal or best state: the contrast between the ideal state and the best that is historically real or practicable	851
6a. The political institutions of the ideal state	
6b. The social and economic arrangements of the ideal state	
7. Factors affecting the quality of states	852
7a. Wealth and political welfare	
7b. The importance of the arts and sciences in political life	
7c. The state's concern with religion and morals: the cultivation of the virtues	
7d. The educational task of the state: the trained intelligence of the citizens	853
8. The offices of state: the statesman, king, or prince	854
8a. The duties of public office and the responsibilities of office holders: the relation of the statesman or king to the people he represents or rules	
8b. The qualities or virtues necessary for the good statesman or king	
8c. The education or training of the statesman or prince	856
8d. Statecraft: the art or science of governing; political prudence	
(1) The employment of the military arts	
(2) The occasions and uses of rhetoric	857
(3) The role or function of experts in the service of the state	
8e. The advantages and disadvantages of participation in political life	
9. The relation of states to one another	858
9a. Commerce and trade between states: commercial rivalries and trade agreements; free trade and tariffs	
9b. Social and cultural barriers between states: the antagonism of diverse customs and ideas	
9c. Honor and justice among states	859
9d. The sovereignty of independent states: the distinction between the sovereignty of the state at home and abroad; internal and external sovereignty	
9e. War and peace between states	860
(1) The military problem of the state: preparation for conquest or defense	
(2) Treaties between states: alliances, leagues, confederacies, or hegemonies	
9f. Colonization and imperialism: the economic and political factors in empire	861
10. Historic formations of the state: the rise and decline of different types of states	
10a. The city-state	
10b. The imperial state	862
10c. The feudal state	
10d. The national state	
10e. The federal state: confederacies and federal unions	
10f. The ideal of a world state	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b 164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 91: TEMPERANCE

INTRODUCTION

MOST outstanding figures in history, most heroes of legend or fiction, are men of strong passions, of ambition, and of pride. They are driven by desires which tend to be limitless. Few exemplify moderation. Few stop short of excess in anger or love, or in their striving for power and pleasure. They may curb their appetites in one direction, only to indulge them without rein in another. They do not follow in all things the counsels of temperance, expressed by the ancient maxim "Nothing overmuch."

Achilles is not temperate in his wrath, nor does Odysseus, for all his craft and cunning, exhibit self-control when his vanity or curiosity is at stake. The tragedies of Euripides, more perhaps than those of Sophocles and Aeschylus, embody the hubris, or pride, which is common to all tragic figures in some particular form of intemperance, such as the boundless hate of Medea or the abstemiousness of Hippolytus. One play especially, *Bacchantes*, takes intemperance for its central theme and sets the disciples of the dionysiac spirit in mortal conflict with the puritans and their prohibitions. Comedy as well as tragedy flows from intemperance, as when we smile at the exaggerated sentimentality of the romantic lovers described by Cervantes and Fielding, Chaucer and Shakespeare, or find merriment in the indulgences of Sir John Falstaff, Pantagruel and Panurge, or Tristram Shandy.

The great books of history add their evidence. They make fiction seem pale by comparison with the excesses of cruelty and sensuality which, if they were not presented as fact, might be dismissed as unimaginable. Page after page of Tacitus and Gibbon often describe, in an unrelieved sequence, human debauchery, brutalities and revelries ingeniously designed to reach some new extreme in order to procure, through novelty, satisfaction for appetites al-

ready over-indulged and weary of familiar pleasures.

Nor is the historian's panorama of intemperance limited to the uncontrolled indulgences of the few—the oriental despots described by Herodotus, or the Caesars and their retinues in the imperial court of Rome. Armies in the field and the mob-formations of civilian life are depicted in wanton and riotous behavior. Whole peoples are described as being given to luxurious living or as wanting in standards of public decency. The few exceptions in antiquity, such as Spartan rigor or the chastity, if not the sobriety, of the primitive Germans, only accentuate by contrast the immoderate tenor of life in most ancient societies.

DARWIN SEEMS to think that a much greater degree of self-control characterizes modern life, both public and private, though his opinion on this score may give undue weight to the conventions so much insisted upon in England under Queen Victoria. Temperance, according to him, is a virtue peculiar to civilized life. "The greatest intemperance," he writes, "is no reproach with savages."

Darwin places temperance along with prudence among the "so-called self-regarding virtues, which do not obviously, though they may really, affect the welfare of the tribe" and which "have never been esteemed by savages, though now highly appreciated by civilized nations." That Darwin has modern society in mind when he speaks of "civilized nations," may be inferred from his remarks about the sensuality of the Greeks and Romans. This seems to be confirmed by his statement that "the hatred of indecency . . . which is so valuable an aid to chastity, is a modern virtue, appertaining exclusively . . . to civilized life."

What may be noted here and questioned—

in addition to the validity of Darwin's comparison of modern and ancient culture—is the tendency to identify temperance with chastity, or at least with restraint, if not abstinence, in the sphere of the sexual impulses. In our day, the general notion of virtue is often restricted to the virtue of chastity, as when we use the words “virtuous woman” to signify one who is chaste, or “woman of easy virtue” to signify one who is not. But spectacles of gluttony and drunkenness, of avarice or greed, are ever present to remind us that man can be intemperate in more ways than one. Darwin's implication of progress from licentious to moderate living may have less justification when we consider all the forms which intemperance can take.

Darwin, furthermore, seems to distinguish between courage and temperance in relation to the level or degree of civilization. Unlike temperance, courage, he thinks, is demanded by primitive as well as civilized life because it concerns the welfare of society as much as the well-being of the individual. Since “no man can be useful or faithful to his tribe without courage, this quality,” he says, “has universally been placed in the highest rank.” On the point of this comparison between the two virtues, Freud appears to disagree. Though he too considers temperance or self-control largely in the sphere of the sexual instincts, he seems to think that any form of organized social life, whether regarded as primitive or civilized, exacts certain restraints from the individual for the sake of the common good. Temperance no less than courage serves the tribe or the state.

“Civilization has been built up,” Freud writes, “under the pressure of the struggle for existence, by sacrifices in gratification of the primitive impulses, and that is to a great extent forever being re-created as each individual, successively joining the community, repeats the sacrifice of his instinctive pleasures for the common good. The sexual are amongst the most important of the instinctive forces thus utilized; they are in this way sublimated, that is to say, their energy is turned aside from its sexual goal and diverted towards other ends, no longer sexual, and socially more valuable.”

Society may depend on the temperance of its members without being able to exact temperance from them. Writers like J. S. Mill, for

example, question the right of society to enforce temperance upon its members by the enactment of sumptuary laws, especially with regard to food and drink. The supposition seems to be that the intemperate man injures only himself—to do which is the prerogative of his personal liberty—whereas the unjust man injures others. We shall return to the consideration of this issue later, after we have examined the nature of temperance and its relation to other virtues, such as justice, courage, and wisdom or prudence.

IF THE POETS AND the historians describe the prevalence and the range of man's intemperance, the moralists tend to be unanimous in recommending self-control or moderation. There is hardly any variety of moral theory—whether developed in terms of law and duty or in terms of happiness and virtue, whether appealing to *a priori* principles or to criteria of utility empirically applied—which does not recommend the discipline of desire by reason and which does not condemn sensuality, self-indulgence, unchecked appetites, or passions run wild.

The word “temperance” itself is not always used, nor is the technical notion of virtue always implied, by those who advocate what Milton calls “the rule of not too much, by temperance taught.” For some writers, on the other hand, temperance and virtue are almost identical. They think the essence of temperance is moderation and the virtuous life is the reasonable one. It is one in which reason moderates the passions and limits the pursuit of pleasure.

For example, Freud's theory of the reality-principle seems to reflect traditional notions of temperance. A person dominated by the pleasure-principle is infantile in character. “The transition from the pleasure-principle to the reality-principle,” he points out, “is one of the most important advances in the development of the ego.” When “the ego learns that it must inevitably go without immediate satisfaction, postpone gratification, learn to endure a degree of pain, and altogether renounce certain sources of pleasure,” it “becomes ‘reasonable,’ is no longer controlled by the pleasure-principle, but follows the reality-principle,” which seeks “a delayed and diminished pleasure, one which is assured by its realization of fact, its relation to reality.”

So, too, Spinoza's doctrine that human bondage consists in being subject to the tyranny of the passions, whereas human freedom stems from the rule of reason, can be read as an apostrophe to temperance. Descartes' maxim, 'to try always to conquer myself rather than fortune, and to alter my desires rather than change the order of the world,' is still another expression of the insight that peace of mind comes from self control. Though Kant does not think temperance deserves "to be called good with out qualification," he does affirm that moderation in the affections and passions, self control and calm deliberation, are not only good in many respects, but even seem to constitute part of the intrinsic worth of the person."

IT IS MONTAIGNE WHO magnifies temperance beyond virtue, and makes it the measure of the sound pursuit of every sort of good, even virtue itself. Without temperance, he writes in his essay "Of Moderation," we can corrupt things that in themselves are laudable and good, we may grasp virtue so that it becomes vicious, if we embrace it too stringently and with too violent a desire." Montaigne opposes 'those who say there is never any excess in virtue.' On the contrary, he thinks that 'a man may both be too much in love with virtue, and be excessive in a just action. . . I love temperate and moderate natures. An immoderate zeal, even to that which is good, though it does not offend, astonishes me, and puts me to study what name to give it."

As with virtue, so with wisdom or philosophy. He quotes Holy Writ to the effect that we should be soberly wise, not try to be wiser than befits our natures. We should not "dive into philosophy beyond the limits of profit, taken moderately, it is pleasant and useful." There is, in short, "no pleasure so just and lawful, where intemperance and excess are not to be condemned."

Montaigne sees temperance as augmenting the pleasure of life rather than diminishing it. He subscribes to Plato's statement in the *Lysis* that "the temperate life is in all things gentle, having gentle pains and gentle pleasures, whereas the intemperate life . . . has violent pains and pleasures, and vehement and stinging desires, and loves utterly insane, and in the tem-

perate life the pleasures exceed the pains, but in the intemperate life the pains exceed the pleasures in greatness and number and frequency." To overlook this, Montaigne elsewhere suggests, is to suppose that "the regimen which stops the toper before he has drunk himself drunk, the glutton before he has eaten to a surfeit, and the lecher before he has got the pox, is an enemy to pleasure." Yet, in his love of "temperate and moderate natures," Montaigne repeatedly counsels us to avoid being overzealous even about temperance itself. The maxim "Nothing overmuch" applies to virtue as well as to the pleasure seeking that virtue tries to control.

CONSIDERED IN TERMS of Aristotle's theory that all the moral virtues consist in a mean between excess and defect, Montaigne seems to be identifying moderation with the observance of the mean, so that moderation becomes an aspect of every virtue, including temperance itself as one virtue among others. Thus the courageous man is one who fears neither too much nor too little, but is moderate with respect to peril and pain. Accordingly, a man cannot be too courageous, but only too fearless, and so rich or foolhardy.

But it may be supposed that if moderation enters into all the virtues, such virtues as temperance and courage are not distinct. Holding them to be distinct in regard to the objects with which they deal, Aquinas admits that each of the major virtues can be taken to denote certain general conditions of virtue, 'so that in a sense they overflow into one another. He defines temperance as 'a disposition of the soul, moderating any passions or acts, so as to keep them within bounds,' and fortitude is 'a disposition whereby the soul is strengthened for that which is in accord with reason, against any assaults of the passions or the toil involved in any work to be done.' So conceived, Aquinas thinks it is possible to see how temperance and fortitude are in some sense one.

The man who can curb his desires for the pleasures of touch is more able to check his daring in the face of danger, 'and in this sense fortitude is said to be temperate.' The man who is able to stand firm against the dangers of death is more able to remain firm against the onslaught of pleasures, and so "temperance can be

said to be brave." Thus temperance enters into other virtues, insofar as it leads men to "observe the mean in all things," just as fortitude enters into temperance because it strengthens men against "the enticements of pleasure" as well as against the fear of pain.

The general theory of virtue, in terms of which the several virtues are distinguished and their connections traced, is discussed in the chapter on VIRTUE AND VICE; and the special virtues to which temperance is related are considered in the chapters on COURAGE, JUSTICE, and PRUDENCE. Here we must be concerned to observe how the general conception of virtue is exemplified in the definitions of temperance given by those who, like Plato, Aristotle, and Aquinas, consider it to be, not the whole of virtue, but one of the major virtues and distinct from the others.

THOUGH PLATO AND Aristotle do not conceive virtue in the same way, and though they diverge in analyzing particular virtues, such as justice or wisdom, and in describing how particular virtues are related to one another, they nevertheless seem to concur on a number of points in their treatment of temperance.

In the *Gorgias*, Callicles asserts that only those who are unable to satisfy their desire for pleasures praise temperance, and call intemperance base. But, he asks, "what could be more truly base or evil than temperance to a man . . . who might freely be enjoying every good and has no one to stand in his way?" And he concludes by saying that "luxury and intemperance and license, if they be provided with means, are virtue and happiness."

In reply, Socrates tries to persuade Callicles that "instead of the intemperate and insatiate life," one should "choose that which is orderly and sufficient and has a due provision for daily needs." He compares the intemperate man "to a vessel full of holes, because it can never be satisfied." By analogy with the sound and the leaky vessel, Socrates describes the temperate man as able to satisfy his limited desires, whereas the intemperate man, of boundless desire, can never pause in his search for pleasure. "If he pauses for a moment, he is in an agony of pain. Such are their respective lives," he adds, "and now would you say that the life of the intem-

perate is happier than that of the temperate?"

Callicles claims to be unconvinced, but later Socrates gets him to admit that in all things—in a house or a ship, in the body or the soul—order is good, and disorder evil. He then proceeds to point out that order is the principle of health in the body and of temperance in the soul. It is in these terms that Socrates defines temperance in the *Republic* as "the ordering or controlling of certain pleasures and desires." In the human soul, he explains, "there is a better and also a worse principle; and when the better has the worse under control, then a man is said to be master of himself."

The words "temperance" and "self-mastery" are almost interchangeable; both signify "the rule of the better part over the worse." Just as the courageous man is one "whose spirit retains in pleasure and in pain the commands of reason about what he ought or ought not to fear," so the temperate man is one in whom the "ruling principle of reason and the two subject ones of spirit and desire are equally agreed that reason ought to rule."

In somewhat similar terms, Aristotle defines temperance and courage by reference to pleasure and pain. "The man who abstains from bodily pleasures and delights in this very fact is temperate, while the man who is annoyed at it is self-indulgent; and he who stands his ground against things that are terrible and delights in this or at least is not pained is brave, while the man who is pained is a coward." Like Plato, Aristotle makes the rational principle the source of these virtues. It is reason, or more precisely one of reason's virtues, prudence, which determines the mean between excess and defect with regard to pleasure and pain, or fear, anger, and the other passions.

Like Freud, Aristotle regards self-indulgence as infantile or childish. Children "live at the beck and call of appetite, and it is in them that the desire for what is pleasant is strongest." When such desire is not regulated by reason, "it will go to great lengths; for in an irrational being the desire for pleasure is insatiable even if it tries every source of gratification." Where Freud speaks of the pleasure-principle submitting to the reality-principle, Aristotle says, "as the child should live according to the direction of his tutor, so the appetitive element

should live according to the rational principle. The appetitive element in a temperate man should harmonize with the rational principle."

According to Aristotle, temperance is concerned not with all pleasures, but "with the kind of pleasures that other animals share in, which therefore appear slavish and brutish; these are touch and taste." Self-indulgence is a matter of reproach "because it attaches to us not as men but as animals. To delight in such things and to love them above all others is brutish."

The endurance of pain, which is central to the nature of courage, enters into temperance incidentally. The self-indulgent man "is pained more than he ought at not getting pleasant things," whereas the temperate man "is not pained at the absence of what is pleasant or at his abstinence from it." But total abstinence is not temperance, any more than over-indulgence is. "The temperate man occupies a middle position" between those who have an insatiable craving for pleasure and those "who fall short with regard to pleasures and delight in them less than they should." Such insensibility, Aristotle declares, is not human either.

When reason curbs the desire for bodily pleasures, "it is not to lessen sensual pleasure," in the opinion of Aquinas, "but to prevent the force of concupiscence from cleaving to it immoderately. By *immoderately*," he explains, "I mean going beyond the bounds of reason, as a sober person does not take less pleasure in food eaten in moderation than the glutton, but his concupiscence lingers less in such pleasures." Though Aquinas agrees with Aristotle in defining temperance strictly as moderation with respect to the pleasures of taste and touch, "such as the pleasures of the table or of sex," he associates with temperance those virtues which involve moderation with respect to other pleasures.

For example, there is liberality with respect to money as an object of love or pleasure. Neither the spendthrift nor the miser is temperate. Friendliness or affability and gentleness represent temperance in the relation of a man to the pleasures of fellowship; and the virtue which Aristotle calls *eutrapelia* is similarly classified by Aquinas, as being a moderate indulgence in the pleasures of recreation, of sport

and games, the opposites of which, in excess and defect, can be called "buffoonery" and "boorishness." Even the pleasures of learning can be pursued intemperately, so that an undue craving for knowledge—beyond the proper limits and for the wrong reasons—is, according to Aquinas, the vice of curiosity.

THE NOTIONS OF ABSTINENCE and continence seem to be closely related to the idea of temperance. The words are often used interchangeably. But as we have seen, according to the theory of virtue as a mean between extremes of excess and defect, temperance calls for a moderate indulgence in pleasures, not abstinence from them entirely. This raises the question whether the asceticism of the religious life violates the rule of reason by a kind of immoderate withdrawal from ordinary pleasures. What to the psychoanalyst may look like pathological self-denial, or to the philosopher like a violation of nature, takes, in the eyes of the Christian theologian, the form of heroic temperance, a supernatural perfection of the virtue.

When in the religious life a man does "his utmost to strive onward to divine things," then, according to Aquinas, in those who are "tending towards the divine similitude," temperance is a *perfecting* virtue. "So far as nature allows," it "neglects the needs of the body." In those "who have already attained to the divine likeness, the *perfect* virtue of temperance" is one which "knows no earthly desires."

Since "use of sexual union hinders the mind from giving itself wholly to the service of God," and since "the use of *venery* withdraws the mind from that perfect intentness on tending to God," the perpetual continence of the celibate life, as well as the voluntary poverty of the monastic life, seem to Aquinas "requisite for religious perfection."

Augustine, in his *Confessions*, tells of the time when "I thought I should be impossibly miserable if I had to forego the embraces of a woman; and I did not think of Your mercy as a healing medicine for that weakness, because I had never tried it. I thought that continency was a matter of our own strength, and I knew that I had not the strength; for in my utter foolishness I did not know the word of Your Scripture that none can be continent unless you give it."

Though he separated from his mistress in order to prepare for marriage, he discovered that "it was not really marriage that I wanted. I was simply a slave to lust." He recounts the struggles which finally enabled him to turn in the other direction and to "see the austere beauty of Continence, serene and indeed joyous"; and with her, he adds, "I saw such hosts of young men and women . . . gray widows and women grown old in virginity, and in them all Continence herself, not barren but the fruitful mother of children, her joys, by You, Lord, her Spouse."

But there is another meaning of continence according to which it is condemned by the philosopher who conceives temperance as a natural virtue. The reason for Aristotle's condemnation of continence differs from the reason he gives for his disapproval of abstinence. Abstinence—at least on the natural plane—is an immoderate denial of pleasure. Continence is opposed to temperance because it merely represents man's inhibition of the act prompted by a licentious desire for pleasure. It is not an habitual moderation of desire itself. Aristotle's emphasis on habit, therefore, leads him to insist upon the distinction between temperance and continence.

"We group together the incontinent and the self-indulgent, the continent and the temperate man," Aristotle writes, "because they are concerned somehow with the same pleasures and pain; but though they are concerned with the same objects, they are not similarly related to them." The difference lies in the fact that a man acts continently in a particular situation when his reason is able to overcome an immoderate desire for pleasure, and incontinently when the force of his desire brushes reason aside; whereas a man not only acts temperately, but is temperate in character, when his desires are themselves habitually moderated to be in accord with reason.

The temperate man, therefore, has no need for continence. Nor is the incontinent man to be confused with the intemperate, for the latter is not convinced that his desires are inordinate. The continent man is one who, when acting against reason, knows that he is doing so. Though both the continent and the temperate man do nothing contrary to the rule of reason for the

sake of bodily pleasures, the one, according to Aristotle, has bad appetites, the other is free from them.

THE CONTINENT MAN is not the only one who gives the appearance of temperance without being really temperate in character. Some men, says Aristotle, are moderate by nature—"from the very moment of birth fitted for self-control." What appears to be temperance in them, therefore, is not, in his opinion, a virtuous habit acquired by good acts, but simply a natural capacity to control their desires or a temperamental constitution which happens not to be ridden by very strong desires. They do not deserve to be praised for their apparent self-control; neither do those who manage to be moderate about certain pleasures but give themselves free rein with respect to other desires. The miser who limits his bodily comforts in order to amass a pile of gold is hardly temperate.

Gibbon writes of the Emperor Julian that he "seldom recollected the fundamental maxim of Aristotle, that true virtue is placed at an equal distance between the opposite vices." Julian's lack of temperance appears, however, not merely in the opposite extreme to which he went to express his contempt for luxury, sleeping on the ground and renouncing the decencies of dress and cleanliness. Though genuinely moderate in some things, such as his diet, he went to excess in others, overdoing his preoccupation with affairs of state and working incessantly for long hours day after day. He "considered every moment as lost that was not devoted to the advantage of the public or the improvement of his own mind. By this avarice of time," Gibbon observes, "he seemed to protract the short duration of his reign."

Temperance in a particular respect is sometimes praised as a virtue relative to a specific and limited goal. Considering the wealth of nations, Adam Smith looks upon prodigality as a major vice, and regards parsimony as an indispensable virtue. "Capitals are increased by parsimony," he writes, "and diminished by prodigality and misconduct . . . Parsimony, and not industry, is the immediate cause of the increase of capital . . . By what a frugal man annually saves, he not only affords maintenance to an additional number of productive hands, for that

or the ensuing year, but, like the founder of a public workhouse, he establishes as it were a perpetual fund for the maintenance of an equal number in all times to come."

Capital funds are perverted by the prodigal. "By not confining his expenses within his income," Smith declares, "he encroaches upon his capital . . . By diminishing the funds designed for the employment of productive labor, he necessarily diminishes . . . the quantity of that labor which adds a value to the subject upon which it is bestowed, and, consequently, the value of the annual produce of the land and labour of the whole country. . . . If the prodigality of some was not compensated by the frugality of others, the conduct of every prodigal, by feeding the idle with the bread of the industrious, tends not only to beggar himself, but to impoverish his country."

From the point of view of augmenting wealth, Smith may be right in calling every prodigal "a public enemy and every frugal man a public benefactor." Marx, however, raises the question whether thrift or parsimony represents moral virtue in the capitalist himself. He mocks the classical, or what he calls the "vulgar," economic theory which tends to identify capital with abstinence, and, taking Adam Smith's statement that "industry furnishes the material which saving accumulates," he interprets *saving* to mean the *reconversion of the greatest possible portion of surplus-value or surplus-product into capital*.

For Marx the question is, in addition to being economic, a moral and psychological one. He describes the capitalist as suffering from "a Faustian conflict between the passion for accumulation and the desire for enjoyment." His parsimony, or abstinence from certain pleasures, hardly signifies genuine temperance; for, according to Marx, the capitalist is like the hoarder who "makes a sacrifice of the lusts of the flesh to his gold fetish." Elsewhere he says that the "boundless greed after riches . . . is common to the capitalist and the miser; but while the miser is merely a capitalist gone mad, the capitalist is a rational miser."

In Marx's opinion the capitalist cannot even boast of personal thrift to any great extent. "The capitalist gets rich, not like the miser, in proportion to his personal labor and restricted

consumption, but at the same rate as he squeezes out the labor-power of others, and enforces on the laborer abstinence from all life's enjoyments."

THESE CONSIDERATIONS OF political economy lead us naturally back to the issue raised earlier, concerning the significance of temperance for society, or the effect of private intemperance on the public welfare.

What is the relation between temperance and justice? Aristotle answers this question in terms of his conception of general justice as including the social aspect of all the other moral virtues. To the extent that his courage or temperance can affect others or the common good, a man is required by justice to be temperate and brave. It is proper for the law, he says, to bid us do "both the acts of a brave man (*e.g.*, not to desert our post nor take flight nor throw away our arms) and those of a temperate man (*e.g.*, not to commit adultery nor to gratify one's lust)."

Though he accepts Aristotle's notion of general justice, Aquinas puts a limitation on the extent to which the positive law of the state can regulate or enforce the acts of a virtue like temperance. Because it is "framed for a multitude of human beings, the majority of whom are not perfect in virtue . . . human laws do not forbid all vices, from which the virtuous abstain, but only the more grievous vices, from which it is possible for the majority to abstain; and chiefly those that are injurious to others, without the prohibition of which human society could not be maintained." The point is not that some acts of temperance cannot be prescribed by law, but rather that the human law does not command every act of temperance, but only those "which are ordainable to the common good."

The principle being clear, the problem remains extremely difficult when the question is one of regulating certain types of behavior, such as insobriety, extravagance, or adultery.

Montesquieu discusses the difficulties of administering, under the Julian law, the "punishments decreed by the Roman emperors against the incontinence of women." He considers the advantages and disadvantages, relative to different forms of government, of sumptuary laws directed at maintaining frugality and avoiding

luxury; as, for example, in Venice, where the rich were "compelled by laws to moderation" and were thus so "habituated to parsimony that none but courtesans could make them part with their money." As for sobriety, he seems to think that the problem varies with the climate, the Mohammedan law against the drinking of wine being "improper for cold countries where the climate seems to force them to a kind of national intemperance, very different from personal inebriety. . . . A German drinks through custom, and a Spaniard by choice."

The reasons which have been offered against the legal prohibition of intoxicants are many and various. To those who hold that temperance consists in moderation, not abstinence, "temperance laws" are misguided as well as misnamed. To others, like William James, "drunkenness . . . as teetotalers use the word, is one of the deepest functions of human nature. Half of both the poetry and tragedy of human life

would vanish if alcohol were taken away." To still others, like Mill, such sumptuary laws are wrong in principle because consumption, which they try to regulate, is a private matter.

If an individual's intemperance injures only himself, he may be morally reprobated, but, Mill holds, he ought not to be prosecuted by law. A man who, "through intemperance or extravagance, becomes unable to pay his debts," or becomes incapable of supporting his family, "might be justly punished; but it is for the breach of duty to his family or creditors, not for the extravagance." Again Mill writes: "No person ought to be punished simply for being drunk; but a soldier or a policeman should be punished for being drunk on duty. Whenever, in short, there is a definite damage, or a definite risk of damage, either to another individual or to the public, the case is taken out of the province of liberty, and placed in that of morality or law."

OUTLINE OF TOPICS

	PAGE
1. The nature of temperance	874
1a. The relation of temperance to virtue generally, and to the virtues of courage and justice	
1b. The relation of temperance to knowledge and prudence: the determination of the mean of temperance	875
1c. Temperance and continence: the counterfeits of temperance	
2. The varieties of intemperance: the related vices of sensuality, abstemiousness, cruelty, curiosity, inordinate desire	876
3. Temperance in relation to duty or happiness	877
4. The cultivation of temperance: the training of a temperate character	
5. The social aspects of temperance	878
5a. The temperance of rulers and citizens: intemperate conduct as inimical to the common good	
5b. The temperance of a people: luxurious indulgences; the intemperance of the mob	
5c. Laws concerning temperance: the extent to which the sphere of temperance can be regulated by law	879
6. The extremes of temperance and intemperance	
6a. Asceticism: heroic temperance	
6b. The dionysiac spirit: the cult of pleasure	880

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 92: THEOLOGY

INTRODUCTION

IT has seldom been disputed that the questions with which theology deals are of critical significance for all the rest of human knowledge. Even those who deny that theology is or can be a science might be willing to concede that, if it were, it would deserve its traditional title, "queen of the sciences."

It has been said that the great questions of theology are unanswerable. It has been said that theological dispute or controversy is futile because the issues are not resolvable by argument. But it has rarely been asserted, or even implied, that our outlook would be unaltered and our actions unaffected if we could know, in any degree, the answers to questions concerning the existence of the supernatural and its relation to the visible world of nature. To Plato it is of such importance that he asks: "Who can be calm when he is called upon to prove the existence of the gods?"

The main controversy, not in, but about, theology turns on the use of such words as "knowledge" and "science" for a discipline which, both in method and conclusion, seems compelled to go beyond experience and to push reason to (or even beyond) the limit of its powers. In the minds of many, especially in our day, theology is associated with religion and is opposed to science or, if not opposed, at least it is set apart from science as entirely different. Those who conceive science as limited by its empirical methods to the investigation of observable phenomena might not quarrel with the allocation of theology to philosophy, but whether or not they did would in turn depend on their conception of philosophy.

As the chapters on SCIENCE and PHILOSOPHY indicate, these two terms are identified through a large part of the western tradition. The various sciences are regarded as branches of philosophy. But we also find a distinction being made

in the 18th century between the empirical and rational or philosophical sciences; and in our day those who regard philosophy as mere speculation or opinion contrast it to the experimental disciplines which are thought to be the *only* established bodies of knowledge, that is, sciences.

The question whether theology is a science may, therefore, embrace a number of alternatives. That it is an empirical or experimental science has seldom been proposed. It may be treated as a science, however, by those who consider it as a part of philosophy; or it may be denied that honor precisely because it belongs to philosophy. A third alternative remains—that theology is separate from philosophy, that it is a science as distinct in character from the philosophical sciences as they are from the experimental disciplines. In this third alternative, the association of theology with religion or religious faith seems to determine the character of theology.

It is this third alternative which Hume seems to have in mind at the conclusion of his *Enquiry*. "Divinity or Theology, as it proves the existence of a Deity and the immortality of souls . . . has," he writes, "a foundation in *reason*, so far as it is supported by experience. But its best and most solid foundation is *faith* or divine revelation." To the extent that its principles come from religious faith, theology does not seem to fit perfectly into Hume's twofold division of the sciences into those which involve "abstract reasoning concerning quantity or number" and those which involve "experimental reasoning concerning matter of fact and existence."

When he says that he would commit to the flames "any volume of divinity or school metaphysics which does not contain either of these two kinds of reasoning"—for then "it can contain nothing but sophistry and illusion"—he can hardly be condemning the theology he has

himself described as resting primarily on faith or divine revelation, though it may also have some foundation in reasoning from experience.

THE DISCUSSION OF THE nature and scope of theology, its principles and methods, may refer either to the theology which is a part of philosophy or to the theology which is sometimes called "dogmatic" because it expounds and explains the dogmas of a religious faith. Furthermore, those who make the distinction between the two kinds of theology raise questions concerning their relation to one another. In so doing they enter into the larger problem of the relation of faith and reason, and the limited part which reason can play in the development of a theology which rests on faith.

The distinction itself is made by many writers and in diverse ways. The theology which is entirely philosophical and independent of any religious faith is usually called "natural theology." The name "sacred theology" is given to a body of doctrine which finds its fundamental principles in the articles of a religious faith. The ultimate source of these articles of faith in Jewish, Christian, and Mohammedan theology is the truth revealed in a sacred scripture—the Old and New Testament or the Koran—from which, by interpretation, the articles of faith are drawn.

Bacon, for example, defines "divine philosophy or natural theology" as "that knowledge or rudiment of knowledge concerning God, which may be obtained by the contemplation of his creatures; which knowledge may be truly termed divine in respect of the object, and natural in respect of the light. The bounds of this knowledge are that it suffices to convince atheism, but not to inform religion." In contrast, "inspired theology" or "sacred theology (which in our idiom we call divinity) is grounded only upon the word and oracle of God, and not upon the light of nature."

Kant makes a similar distinction when he says that theology is based either "on reason alone (*theologia rationalis*) or upon revelation (*theologia revelata*)." But for Kant "natural theology" designates only one kind of rational theology. Another kind is "transcendental theology," which differs from the first in the method which reason employs. He also differentiates be-

tween speculative and moral theology. Though both fall within the sphere of reason, one is the work of the pure theoretic reason, the other of the pure practical reason.

In the opening question of the *Summa Theologica*, Aquinas tries to explain why, in addition to the "philosophical science built up by reason, there should be a sacred science learned through revelation." To an objection which claims that "there is no need of any further knowledge," because philosophical science can attain to knowledge even of God Himself, he replies that "there is no reason why those things which may be learnt from philosophical science, so far as they can be known by natural reason, may not also be taught us by another science so far as they fall within revelation." Though they may deal with the same object, "sciences are differentiated according to the various means through which knowledge is obtained. . . . Hence the theology included in sacred doctrine differs in kind from that theology which is part of philosophy."

In another place, Aquinas refers to the theological conclusions which the philosopher thinks he can demonstrate—"the existence of God and other like truths about God which can be known by natural reason." Of these he says that they "are not articles of faith, but are preambles to the articles. . . . Nevertheless," he adds, "there is nothing to prevent a man, who cannot grasp a proof, accepting as a matter of faith, something which in itself is capable of being scientifically known and demonstrated." But such propositions, which belong to both reason and faith, are only part of sacred doctrine. In addition, there are the propositions which belong to faith alone.

"It is impossible," Aquinas writes, "to attain to the knowledge of the Trinity by natural reason." The triune nature of the Godhead cannot be demonstrated philosophically; nor can the dogma be fully comprehended by human understanding. In Purgatory, Dante learns that "Mad is he who hopes that our reason can traverse the infinite way which One Substance in Three Persons holds."

Though it is not a theological mystery in the same sense, another example of a dogma not demonstrable by reason is the proposition that the world began to be. "That the world did not

always exist," Aquinas declares, "we hold by faith alone; it cannot be proved demonstratively; which is what was said above of the mystery of the Trinity." We find in Sacred Scripture the words *In the beginning God created heaven and earth*, "in which words the newness of the world is stated" and so "the newness of the world is known only by revelation."

With respect to such matters as belong to faith alone, a theologian like Aquinas cautions against the misuse of reason. "When anyone in the endeavor to prove what belongs to faith, brings forward arguments which are not cogent, he falls under the ridicule of the unbelievers; since they suppose that we base ourselves upon such arguments, and that we believe on their account. Therefore, we must not attempt to establish what is of faith, except by authority alone" and only "to those who accept the authority." For those who do not accept the authority of Scripture, the most that reason can do concerning propositions peculiar to faith is "to prove that what faith teaches is not impossible." Elsewhere Aquinas points out that "although the argument from authority based on human reason is the weakest, yet the argument from authority based on divine revelation is the strongest."

THE FOREGOING THROWS some light on Montaigne's defense of a book by Raimond de Sebonde, bearing the title *La theologie naturelle*. Though he calls his work "natural theology," de Sebonde, according to Montaigne, "undertakes by human and natural reasons to establish and make good against the atheists all the articles of the Christian religion." What his opponents "reprehend in his work is that Christians are to blame to repose upon human reasons their belief, which is only conceived by faith and the particular inspiration of divine grace."

Montaigne agrees that it is "faith alone that vividly and certainly comprehends the deep mysteries of our religion." But he also thinks that it is "a brave and very laudable attempt to accommodate the natural and human capabilities that God has endowed us with to the service of our faith. It is not to be doubted," he says, "that it is the most noble use we can put them to, and that there is no design or occupation

more worthy of a Christian man than to make it the aim and end of all of his thoughts and studies to embellish, extend, and amplify the truth of his belief."

The conception of natural theology which Montaigne appears to entertain in his "Apology for Raimond de Sebonde" does not seem to differentiate it from sacred theology, insofar as all its principles are articles of faith. Quite apart from de Sebonde, Montaigne himself does not think that the existence of God or the immortality of the soul can be demonstrated by reason. Montaigne observes "how short the most constant and firm maintainers of this just and clear persuasion of the immortality of the soul fall, and how weak their arguments are, when they go about to prove it by human reason. . . . Let us ingenuously confess that God alone has dictated it to us, and faith; 'tis no lesson of nature and our own reason."

Though the denial of God's existence is, according to Montaigne, "a proposition unnatural and monstrous, difficult also and hard to establish in the human understanding," he thinks the affirmation to be no less beyond reason's power to establish with certitude, for "all things produced by our own reasoning and understanding, whether true or false, are subject to incertitude and controversy."

In this, Montaigne differs not only from a theologian like Aquinas, who assigns certain truths to natural theology as capable of being demonstrated by reason without the aid of faith, but also from such philosophers as Descartes, Spinoza, and Locke, who hold that we can know God by reason with more certainty, and even (according to Spinoza) more adequately, than we can know most other things. "I have always considered," Descartes writes, "that the two questions respecting God and the Soul were the chief of those that ought to be demonstrated by philosophical rather than theological argument. For although it is quite enough for us faithful ones to accept by means of faith the fact that the human soul does not perish with the body, and that God exists, it certainly does not seem possible ever to persuade infidels of any religion . . . unless, to begin with, we prove these two facts by means of the natural reason."

Descartes, it appears, reserves the use of the

word "theology" for sacred doctrine. What others, like Bacon, call "natural theology," he treats simply as philosophy, or that branch of it which he calls "metaphysics." Dedicating his *Meditations* to "the dean and doctors of the sacred faculty of theology in Paris," he says: "I have noticed that you, along with all the theologians, did not only affirm that the existence of God may be proved by the natural reason, but also that it may be inferred from the Holy Scriptures, that knowledge of Him is much clearer than that which we have of many created things, and, as a matter of fact, is so easy to acquire that those who have it not are culpable in their ignorance."

But Descartes wishes to confess the limitations of the mere philosopher's knowledge of God. When he came to inquire "how God may be more easily and certainly known than the things of this world," no matter how much "certainty and evidence I find in my reasons," he could not persuade himself, he says, that "all the world is capable of understanding them. . . . There are not so many in the world who are fitted for metaphysical speculations as there are for those of geometry."

Answering a critic who quotes Aquinas against him, he later writes: "I admit along with all theologians that God cannot be comprehended by the human mind, and also that He cannot be distinctly known by those who try mentally to grasp Him at once in His entirety. . . . Wherever I have said that God can be clearly and distinctly known, I have understood this to apply only to this finite cognition of ours, which is proportionate to the diminutive capacity of our minds."

SO FAR WE HAVE considered the distinction between natural and sacred theology--or between philosophy and theology--as it is made in the Christian tradition by writers conscious of the difference between faith and reason, or revelation and demonstration. In pagan antiquity, there seems to be no equivalent of sacred theology. "The various modes of worship, which prevailed in the Roman world," Gibbon tells us, "were all considered by the people as equally true; by the philosopher as equally false; and by the magistrate as equally useful. . . . The superstition of the people was

not embittered by theological rancour; nor was it confined by the chains of any speculative system." It was "the elegant mythology of Homer," he says, not reasoning, which "gave a beautiful, and almost a regular form to the polytheism of the ancient world."

Of the Greek philosophers, Gibbon remarks that "they meditated on the Divine Nature as a very curious and important speculation," but only the Stoics and the Platonists "endeavored to reconcile the jarring interests of reason and piety." Plato's criticism of the poets in the *Republic* for their impiety, and his rational defense of piety in the *Laws*, accompanied by a demonstration of the existence of the gods, may be taken as examples of ancient theological discourse within a religious context. Another example, and from quite another point of view, is Cicero's *De Natura Deorum*, which Gibbon praises as the best guide to the opinions of the philosophers concerning the tenets of polytheism.

But neither Cicero nor Plato treats theology as a science. The ancient philosopher who does and who, moreover, regards theology as the highest of the speculative sciences, seems to proceed without reference to or benefit of prevailing religious beliefs. Aristotle dismisses "the school of Hesiod and all the theologians [who] thought only of what was plausible to themselves." He refers to the legends of the gods which "our forefathers in the most remote ages have handed down to their posterity . . . in the form of a myth . . . with a view to the persuasion of the multitude and to its legal and utilitarian expediency." But the highest science, which Aristotle sometimes calls "first philosophy," he also calls "theology." It deals with the immaterial and the insensible, the immovable and eternal. We may call it "theology," he writes, "since it is obvious that if the divine is present anywhere, it is present in things of this sort." In another place he says, "there are three kinds of theoretical sciences--physics, mathematics, theology . . . and of these the last named is best, for it deals with the highest of existing things."

At the beginning of the *Metaphysics*, Aristotle gives another reason for thinking that theology is a divine science: not that it is divinely inspired, but that, having the divine for

THE GREAT IDEAS

its object, it is the science "most meet for God to have. . . . Such a science either God alone can have, or God above all others." The title given the book in which Aristotle attempts to develop this science comes in the later tradition to be the name given to speculation concerning immaterial and insensible substances. What Aristotle calls "theology," Descartes, as we have seen, calls "metaphysics" in order to distinguish it from the theology based on revelation.

Whether the theology of a pagan philosopher is commensurable with the theology of Jewish or Christian thinkers, even when the latter attempt to be purely philosophical or natural theologians, is a question which deeply probes the relation of reason to faith. For even when reason tries to proceed independently of faith, the religious faith of a community may tinge the concepts the philosopher uses and define the problems he undertakes to solve. It may be one thing to prove the existence of a Prime Mover, and another to know by reason the nature and existence of the God who in the beginning created heaven and earth—the God of Abraham, Isaac, and Jacob, the God of the Christians, whom Pascal distinguishes from the God of the philosophers.

Augustine explains his attitude as a theologian toward the theories of the philosophers touching divine matters. "I have not undertaken," he says, "to refute all the vain theological opinions of all the philosophers, but only of such of them as, agreeing in the belief that there is a divine nature, and that this divine nature is concerned about human affairs, do nevertheless deny that the worship of the one unchangeable God is sufficient for the obtaining of a blessed life after death, as well as at the present time." Since "Plato defined the wise man as one who imitates, knows, and loves this God, and who is rendered blessed through fellowship with Him in His own blessedness, why discuss with the other philosophers? It is evident that none come nearer to us than the Platonists."

Plato, according to Augustine, "is justly preferred to all the other philosophers of the Gentiles"; those among his followers who show "the greatest acuteness in understanding him . . . entertain such an idea of God as to admit that in Him are to be found the cause of existence, the

ultimate reason for the understanding, and the end in reference to which the whole life is to be regulated." So amazing, to his mind, are the parallels between certain insights expressed by Plato and the wisdom of Sacred Scripture, that Augustine is almost inclined to believe that "Plato was not ignorant of those writings." But he does not think it necessary to determine whether Plato had acquaintance with the writings of Moses and the prophets, because certain basic truths, which were revealed to the Hebrews, were made known to the gentiles through the light of nature and reason. "That which is known of God," the apostle had said, "has been manifested among them, for God hath manifested it to them."

Therefore Augustine feels justified in taking any truth from Plato which is consistent with Christian faith. Aquinas, borrowing much from Aristotle, explains that "sacred doctrine makes use of the authority of philosophers in those questions in which they were able to know the truth by natural reason." Sacred theology uses the doctrines of the philosophers, he adds, "not as though it stood in need of them, but only in order to make its teaching clearer." It is in this sense that Aquinas calls philosophy the handmaiden of theology.

Others seem to take a different view of this relationship. Montaigne wonders whether it would not be better if "the divine doctrine, as queen and regent of the rest," kept herself apart, and he quotes St. Chrysostom to the effect that philosophy has "long been banished from the holy schools as a handmaid altogether useless." Hobbes goes further. He describes the traditional theology as a mingling of Aristotle's metaphysics with Scripture, and claims that the "bringing of the philosophy and doctrine of Aristotle into religion by the Schoolmen" caused the "many contradictions and absurdities" which "brought the clergy into a reputation both of ignorance and of fraudulent intention, and inclined people to revolt from them."

Hegel, however, dismisses the criticism that is often made concerning the dependence of Christian theology, at least in its formative period, on pagan philosophy. "The Fathers of the Church and the Councils," he writes, "constituted the dogma; but a chief element in this constitution was supplied by the previous de-

velopment of *philosophy*." That certain dogmas were introduced into the Christian religion through "the instrumentality of philosophy . . . is not sufficient ground for asserting that they were foreign to Christianity and had nothing to do with it. It is a matter of perfect indifference where a thing originated; the only question," Hegel insists, "is, 'Is it true in and for itself?'" Many think that by pronouncing the doctrine to be Neo-Platonic, they have *ipso facto* banished it from Christianity. Whether a Christian doctrine stands exactly thus and thus in the Bible . . . is not the only question. The Letter kills, the Spirit makes alive."

COMPARED WITH SACRED theology, the subject matter of natural theology and the scope of its problems seem to be extremely narrow. At most, it is only a part of philosophy, and some writers treat it as no more than one part of metaphysics.

Kant, for example, divides metaphysics into three parts—*theology*, *cosmology*, and *psychology*—according to his conception of metaphysics as having "for the proper object of its inquiries only three grand ideas: God, Freedom, and Immortality." As a branch of transcendental speculation, theology is concerned primarily with the problem of God's existence. Similarly, Aristotle's metaphysical inquiries include more than his theology. His theology begins only after he has discussed the nature and being of sensible substances. It is stated mainly in Book XII of the *Metaphysics* where he considers the existence and character of immaterial substances, and of the one purely actual being which is God.

Descartes' conception seems to be broader, for he regards the immortality of the soul as well as the existence and nature of God as being characteristically theological problems even when they are treated in metaphysics and by the methods of the philosopher. Because these two problems concern spiritual beings, Adam Smith also groups them together under the name "pneumatics" or "pneumatology," which he identifies with metaphysics—that part of philosophy most emphasized "in the universities of Europe where philosophy was taught only as subservient to theology." Bacon alone seems to separate natural theology entirely

from metaphysics, which, along with physics, is for him a part of natural rather than divine philosophy. But though he would limit natural theology to that knowledge of God which can be drawn from nature, and excludes attempts to induce from nature "any verity or persuasion concerning the points of faith," he grants that natural as well as divine theology may treat of "the nature of angels and spirits," as "neither inscrutable nor interdicted."

The subject matter of sacred theology, or what he calls "divinity," is, according to Bacon's account, much more extensive. He first divides it into "matter of belief" and "matter of service and adoration"; and from these two derives the "four main branches of divinity: faith, manners, liturgy, and government." The matter of faith contains "the doctrine of the nature of God, of the attributes of God, and of the works of God." Under manners, Bacon lists the consideration of divine law and the breach of it by sin; liturgy concerns the sacraments and rituals of religion; government, the organization, offices, and jurisdictions of the church.

As its title indicates, the *Summa Theologica* of Aquinas endeavors to set forth the sum of theological knowledge. In addition to the topics and problems peculiar to sacred doctrine, the subject matters treated in the *Summa* seem to represent the whole range of human inquiry—almost co-extensive with the scope of the natural sciences and philosophy, both speculative and moral.

Aquinas explains the encyclopedic character of the *Summa* by pointing out that to have God as the subject matter of theology means that sacred doctrine treats "all things under the aspect of God, either because they are God Himself, or because they refer to God as their beginning and end." The unity of theology in covering so wide a diversity of matters consists in the single formality under which they are considered—the formality of being divinely revealed. That is why "objects which are the subject matter of different philosophical sciences can yet be treated by this one single sacred science under one aspect, namely, insofar as they can be included in revelation."

Thus, for example, in the preamble to his *Treatise on Man*, Aquinas writes: "The theologian considers the nature of man in relation to

THE GREAT IDEAS

the soul; but not in relation to the body, except insofar as the body has relation to the soul." This emphasis is dictated by the articles of Christian faith which concern man, in both body and soul. Similarly, with respect to moral matters, Aquinas explains that the theologian "considers human acts inasmuch as man is thereby directed to happiness," and he takes account of the circumstances of human acts because they may excuse from sin, "the consideration of which belongs to the theologian." It belongs to the theologian only when sin is conceived "as an offense against God," but to the moral philosophers when it is conceived "as something contrary to reason."

IT APPEARS FROM THE foregoing that sacred theology is both speculative and practical (or moral). It deals with the nature of divine things and with human acts, but with the latter only so far as they have God for their rule or end. "Although among the philosophical sciences," Aquinas writes, "some are speculative and others practical, sacred doctrine includes both."

Even though it is made on the level of the philosophical sciences, Kant's distinction between speculative and moral theology seems to be based on a different principle. For Aquinas the speculative and the practical parts of theology deal with different problems, such as God, the Trinity, creation, and the angels on the one hand, and beatitude, the virtues, divine law, sin, grace, and sacraments on the other. But for Kant both speculative and moral theology deal with the problem of God's existence. They differ only according to the manner in which the theoretic and the practical reason undertake to solve this problem.

"All attempts of reason to establish a theology by the aid of speculation alone are fruitless," writes Kant. Consequently, "a rational theology can have no existence unless it is founded upon the laws of morality." The postulates of pure practical reason—of immortality, free will, and the existence of God—"all proceed from the principle of morality, which is not a postulate but a law by which reason determines the will directly." The moral law involves, as a necessary condition, "the existence of the *summum bonum*," and that in turn in-

volves "the supposition of the supreme independent good, that is, the existence of God."

According to Kant, a Supreme Being is "for the speculative reason, a mere ideal, though a faultless one—a conception which perfects and crowns the system of human cognition, but the objective reality of which can neither be proved nor disproved by pure reason." It is this defect which moral theology remedies. "We must assume," he says, "a moral world-cause, that is, an Author of the world, if we are to set before ourselves a final end in conformity to the moral law." But, he adds, "this moral argument is not intended to supply an objectively valid proof of the existence of God. It is not meant to demonstrate to the skeptic that there is a God, but that he *must adopt* the assumption of this proposition as a maxim of his practical reason, if he wishes to think in a manner consistent with morality."

THE PROBLEM OF THE proof of God's existence, though central in theology, is more fully discussed in the chapter on God. Here we are concerned with the nature of theology itself as a branch of learning or inquiry. Since the chapter on METAPHYSICS necessarily touches on theology as a philosophical discipline, it seems advisable to devote attention here to some of the things which are peculiarly the concern of sacred theology.

Heresy is one of these. A scientist or philosopher may be criticized for his errors, but only a theologian, only the man who tries to explain some article of faith, can be called a heretic in the strict sense of that word. According to his view of the relation between church and state, Hobbes defines heresy in political terms. "Heresy," he writes, "is nothing else but a private opinion, obstinately maintained, contrary to the opinion which the Public Person"—i.e., the Sovereign—"has commanded to be taught." But, according to Pascal, "none but God was able to instruct the Church in the faith," and so "it is heresy to resist the decisions of the faith, because this amounts to an opposing of our own spirit to the Spirit of God." But, he adds, "it is no heresy, though it may be an act of presumption, to disbelieve certain particular facts, because this is no more than opposing reason—it may be enlightened reason—

to an authority which is great indeed, but in this matter is not infallible."

The aspect of choice, of obstinately preferring one's own opinion against a superior authority, is emphasized by Aquinas, but he adds the specification that heresy is a corruption of Christian faith, a species of unbelief in which the heretic defies the authority of the Church, choosing "not what Christ really taught, but the suggestions of his own mind." He quotes a statement by Augustine that we should not accuse of heresy "those who, however false and perverse their opinion may be, defend it without obstinate fervor" and are "ready to mend their opinion when they have found the truth because they do not make a choice in contradiction to the doctrine of the Church." It is not the falsity of the opinion which makes it heresy, for until the point of faith has been defined by the authority of the Church, theologians may differ, and even be in error, without being heretical.

The inference may be drawn that progress is made in the refinement and precision of theological doctrine as the dogmas of a religion are more fully stated and the line between orthodoxy and heresy becomes more clearly defined. Augustine, who is one of the great formative theologians for the Protestant as well as the Catholic tradition, devotes a large part of his writing to the criticism of heresies—the great Arian heresy concerning the Trinity, the Nestorian or Monophysite heresy concerning the Incarnation, the Manichean heresy concerning the existence of evil, and the Pelagian heresy concerning grace and good works.

"While the hot restlessness of heretics," Augustine writes, "stirs questions about many articles of the catholic faith, the necessity of defending them forces us . . . to investigate them more accurately, to understand them more clearly, and to proclaim them more earnestly"; and the question mooted by an adversary becomes the occasion of instruction. According to Aquinas, "the profit that ensues from heresy is beside the intention of heretics, for it consists in the constancy of the faithful being put to the test and makes us shake off our sluggishness and search the Scriptures more carefully."

To Augustine and Aquinas, theological argu-

ment and controversy seem to be serviceable in the propagation and defense of the faith. Aquinas, for example, distinguishes the various types of dispute in which a Christian theologian can engage—with heretics, with Jews, with infidels. "We can argue with heretics from texts in Holy Scripture," he writes, "and against those who deny one article of faith we can argue from another. If our opponent believes nothing of divine revelation, there is no longer any means of proving the articles of faith by argument, but only of answering his objections—if he has any—against faith."

But it is necessary to add the qualification that the reasons employed "to prove things that are of faith are not demonstrations; they are either persuasive arguments showing that what is proposed by faith is not impossible; or else they are proofs drawn from the principles of faith, *i.e.*, from the authority of Holy Writ. . . . Whatever is based on these principles is as well-proved in the eyes of the faithful, as a conclusion drawn from self-evident principles is in the eyes of all."

Furthermore, Aquinas points out, "since faith rests upon infallible truth, and since the contrary of a truth can never be demonstrated, it is clear that the proofs brought against faith are not demonstrations, but arguments that can be answered." Descartes seems to hold a similar view. Defending his opinions in a letter to Father Dinet, he declares: "As to theology, as one truth can never be contrary to another, it would be a kind of impiety to fear that the truths discovered in philosophy were contrary to those of the true Faith."

A SOMEWHAT CONTRARY view of the relation of faith and reason seems to be taken by Locke. "Whatever God hath revealed," he says, "is certainly true; no doubt can be made of it. This is the proper object of faith; but whether it be a divine revelation, or no, reason must judge." Reason, not faith, is the ultimate test of truth, in theology as in philosophy. "Reason must be our last judge and guide in everything." If reason finds something "to be revealed from God, reason then declares for it, as much as for any other truth, and makes it one of her dictates."

In many of the great books we find a less

favorable view of the merit or profit in theological controversy. Its excesses and mumbo-jumbo are travestied and caricatured by Rabelais and Sterne; its futility and folly are the subject of bitter complaint by Hobbes and Bacon; its intolerance is condemned by Locke and Mill. Gibbon, who reports the disputes which raged through ten centuries of Christendom, seldom speaks kindly of the disputants. He refers to "the exquisite rancor of theological hatred"; and in describing the fury of the conflict between the Arians and the defenders of the Nicene creed, he says that, "in the midsts of their fierce contentions, they easily forgot the doubt which is recommended by philosophy, and the submission which is enjoined by religion."

In the Middle Ages, mystical theologians, like Peter Damiani or Bernard of Clairvaux, attack as impious or irreligious the kind of theology which borrows from the philosophers and makes use of the liberal arts, especially the techniques of the dialectician. In similar vein

Protestant reformers, like Luther, later attack theology itself as detrimental to the purity of Christian faith and the spirit of religion. It is in this vein also that Bacon deplores the "unprofitable subtilty or curiosity" and the "fruitless speculation or controversy" in divinity, and speaks of the "extreme prejudice which both religion and philosophy have received and may receive by being commixed together."

When the Student in *Faust* says, "I'm now almost inclined to try Theology," Mephistopheles replies:

I would not wish to lead you so astray.
In what this science touches, it would be
So hard to shun the false, misleading way;
So much of hidden poison lies therein,
You scarce can tell it from its medicine.

That, however, is the voice of the devil; and from the point of view of those who see no conflict between faith and reason or between piety and inquiry, the attempt to separate religion from theology often looks diabolical.

OUTLINE OF TOPICS

	PAGE
1. The subject matter of theology: the scope of its inquiry; the range of its problems	891
2. The distinction between natural and sacred theology: its relation to the distinction between reason and faith	
3. Theology as a philosophical discipline	892
3a. Natural theology in relation to other parts of philosophy: <i>philosophia prima</i> , metaphysics, natural philosophy	
3b. The distinction between speculative and moral theology: theology as a work of the practical reason	
3c. The limitations of speculative theology: the insoluble mysteries or antinomies	
4. Sacred theology: faith seeking understanding	
4a. The relation of sacred theology to philosophy: theology as the queen of the sciences	
4b. The principles of sacred theology: revealed truth; articles of faith; interpretation of Scripture	
4c. The roles of reason and authority in the development of sacred doctrine: theological argument and proof	893
4d. Sacred theology as a speculative and practical science	
4e. The nature and forms of theological heresy	
5. Criticisms of theology: the dogmatic, sophistical, or over-dialectical character of theological controversy	894

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER: *Iliad*, BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS: When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES: *Psychology*, 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO: *Symposium*, 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS: One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference; line numbers, in brackets, are given in certain cases; e.g., *Iliad*, BK II [265-283] 12d.

BIBLE REFERENCES: The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows; e.g., OLD TESTAMENT: *Nehemiah*, 7:45—(D) *II Esdras*, 7:46.

SYMBOLS: The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference; "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Ideas*, consult the Preface.

Chapter 93: TIME

INTRODUCTION

DEVOURING Time," "wasteful Time," this bloody tyrant, Time" —Time is the predatory villain with whom not only the lover, but all men must contend. The sonnets of Shakespeare make war upon Time's tyranny to stay 'Time's scythe,' to preserve whatever of value can be kept from "the wastes of time," and to prove that "Love's not Time's fool" entirely.

Yet, viewing the almost universal depredations of Time, the poet fears that love may not escape Time's ruin.

When I have seen by Time's fell hand defaced
The rich proud cost of outworn buried age,
When sometime lofty towers I see down razed,
And brass eternal slave to mortal rage,
When I have seen the hungry ocean gain
Advantage on the kingdom of the shore,
And the firm soil win of the watery main,
Increasing store with loss and loss with store,
When I have seen such interchange of state,
Or state itself confounded to decay,
Ruin hath taught me thus to ruminate
That Time will come and take my love away.

This thought is as a death which cannot choose
But weep to have that which it fears to lose.

The lover knows that he cannot save his love from change and her beauty from decay. Time is too much for him. But when the lover is also a poet he may hope to defeat Time not by making his love last forever, but by making the memory of it immortal. 'Do thy worst, old Time,' he can say, 'despite thy wrong My love shall in my verse ever live young.' Or again:

Since brass, nor stone, nor earth, nor boundless sea,
But sad mortality o'er sways their power,
How with this rage shall beauty hold a plea,
Whose action is no stronger than a flower?
O, how shall summer's honey breath hold out
Against the wreckful siege of battering days,
When rocks impregnable are not so stout,
Nor gates of steel so strong, but Time decay?

O fearful meditation! where black
Shall Time's best jewel from Time's chest lie hid?
Or what strong hand can hold his swift foot back?
Or who his spoil of beauty can forbid?

O none, unless this miracle have might,
That in black ink my love may still shine bright.

But the poet may have the cast of a theologian rather than a lover. He may, as Milton does, stand not in awe or fear but in contempt of Time, willing to wait while Time runs out its race. Milton bids Time:

glut thyself with what thy womb devours
Which is no more than what is false and vain
And merely mortal dross
So little is our loss
So little is thy gain
For when as each thing, hid thou hast entomb'd,
And list of all thy greedily self consum'd
Then long Eternity shall greet our bliss
With an individual kiss
Then all thy earthly grossness quit
Attired with Stars we shall forever sit
Triumphing over Death and Chance and thee
O Time

A philosopher like Marcus Aurelius neither dreads nor despises time. He enjoins himself to accept the mutability of all things as fitting and suitable to universal nature. Dost thou not see, he asks himself, 'that for thyself also to change is just the same, and equally necessary for the universal nature?' To him it seems 'no evil for things to undergo change', nor is he oppressed by the image of Time as 'a river made up of the events which happen, and a violent stream, for as soon as a thing has been seen, it is carried away, and another comes in its place, and this will be carried away too.'

For man to resign himself to time's passage, Pascal thinks, requires no special effort. 'Our nature consists in motion,' he says, 'complete rest is death.' Time fits our nature, not only because it "heals griefs and quarrels," but because time's perpetual flow washes away the

desperate ennui men suffer when they feel themselves imprisoned in the present.

Just as we seek and multiply diversions as means to escape from ourselves, so, according to Pascal, when we are dissatisfied with the present, "we anticipate the future as too slow in coming . . . or we recall the past, to stop its too rapid flight. . . . For the present is generally painful to us. . . . Let each one examine his thoughts, and he will find them all occupied with the past and the future. . . . The past and present are our means; the future alone is our end. So we never live, but we hope to live; and, as we are always preparing to be happy, it is inevitable we should never be so."

THESE ARE ONLY SOME of the conflicting attitudes toward time and mutability which express man's desire for permanence, for the eternity of a now that stands still, or his restless weariness, his avidity for the novelties time holds in store. Wherever in the great books of poetry, philosophy, or history men reflect upon their loves and aspirations, their knowledge and their institutions, they face man's temporality. It is not that man alone of earthly things has a time-ridden existence, but that his memory and imagination enable him to encompass time, and so save him from being merely rooted in it. Man not only reaches out to the past and future, but he also sometimes lifts himself above the whole of time by conceiving the eternal and the immutable.

Man's apprehension of the past and future is discussed in the chapter on MEMORY AND IMAGINATION. The bent of his mind or his striving toward the unchanging, the everlasting, the eternal, is considered in the chapter on CHANGE. Here we are concerned with his examination of time itself.

Though the idea of time is traditionally linked with that of space, it seems to be much more difficult to grasp. In addition to provoking opposite emotions from the poets, it seems to engage the philosophers in a dispute about its intelligibility. This goes deeper than conflicting definitions or analyses, such as occur in the discussion of both space and time. Whereas time seems no less clear than space to some thinkers, to others it is irremediably obscure. Struggling to say what it is and how it exists,

they are exasperated by its evanescence as an object of thought.

Aristotle indicates some initial difficulties in the consideration of time. It is not itself a movement, yet "neither does time exist without change. . . . Time is neither movement nor independent of movement." Furthermore, according to Aristotle, time is a continuous quantity. "Time, past, present, and future, forms a continuous whole." But the very nature of a continuous quantity is to be divisible. The present moment, however—the 'now' which is "the link of time" and the dividing line between past and future—seems to be an indivisible instant.

If the present had an extended duration, Aristotle points out, it would have to include parts, some of which would be past and some future. Hence though the present seems to be a part of time, it is, unlike the rest of time, indivisible; and though it separates past and future, yet it must also somehow belong to both, for otherwise time would not be continuous. "The 'now' is an end and a beginning of time, not of the same time however, but the end of that which is past and the beginning of that which is to come."

"If we conceive of some point of time which cannot be divided into even the minutest parts of moments," Augustine writes, "that is the only point that can be called the present; and that point flees at such lightning speed from being future to being past, that it has no extent of duration at all." Only past time and future time can be called long or short. Only they have duration. "But in what sense," Augustine asks, "can that which does not exist be long or short? The past no longer is; the future is not yet."

The past and future, it seems, have duration, or at least extent, but no existence. The present exists but does not endure. "What then *is* time? If no one asks me," Augustine says, "I know; if I want to explain it to a questioner, I do not know." All the words with which we speak of time and times "are the plainest and commonest of words, yet again they are profoundly obscure and their meaning remains to be discovered."

Augustine returns again and again to the point that "we measure time *in its passing*." But, he says, "if you ask me how I know this, my answer is that I know it because we measure

time, and we cannot measure what does not exist, and the past and future do not exist. But how do we measure time present, since it has no extent"; and "where does time come from, and by what way does it pass, and where does it go to, while we are measuring it? Where is it from?—obviously from the future. By what way does it pass?—by the present. Where does it go?—into the past. In other words, it passes from that which does not exist, by way of that which lacks extension, into that which is no longer."

The more he reflects on time and its measurement, the more Augustine is perplexed, the more he is forced to say, "I still do not know what time is." He realizes that he has been "talking of time for a long time, and this long time would not be a long time unless time has passed. But how do I know this, since I do not know what time is?" It seems to him true that we measure time, and yet he must say, "I do not know what I am measuring." It seems to him that "time is certainly extendedness—but," he must add, "I do not know what it is extendedness of."

Berkeley suggests that the difficulties in understanding time may be of our own making. "Bid your servant meet you at such a *time* in such a place, and he shall never stay to deliberate on the meaning of those words. . . . But if *time* be taken exclusive of all those particular actions and ideas that diversify the day, merely for the continuation of existence or duration in the abstract, then it will perhaps gravel even a philosopher to comprehend it.

"For my own part," Berkeley goes on to say, "whenever I attempt to frame a simple idea of *time*, abstracted from the succession of ideas in my own mind, which flows uniformly and is participated by all beings, I am lost and embarrassed in inextricable difficulties. I have no notion of it at all."

To those who conceive time as a mathematical magnitude or as a physical dimension, there seems to be no difficulty about its definition or a precise statement of its properties. So considered, time appears to be no less intelligible than space, for when it is so considered it is being treated exactly like space—not as a property of things, not as relative to bodies or their

motions, but as an extensive manifold capable of being occupied by things, and in which they exist and move.

As in what Einstein calls "the four-dimensional space-time continuum" (which comprises three space coordinates and one time coordinate) time is merely one dimension among others, so in Newton's theory time and space are also given parallel treatment. "Times and spaces," Newton writes, "are as it were, the places as well of themselves as of all other things. All things are placed in time as to order of succession; and in space as to order of situation." Einstein criticizes Newtonian mechanics for its "habit of treating time as an independent continuum," yet Newton no less than Einstein appears to conceive time and space alike as dimensions, even if he conceives them in separation from one another.

But if time and space are something to be occupied or filled, they can also be thought of as unoccupied or empty. The opposition, discussed in the chapter on SPACE, between those who think of space in itself as empty, and those who deny a void or vacuum, seems to be paralleled here by the issue concerning empty time—time apart from all change or motion, time in itself. Waiving for the moment the question whether such time exists or is only a mathematical abstraction, we can see that this time may be more susceptible to analysis than the time of ordinary experience, the time which, according to Lucretius, no one feels "by itself abstracted from the motion and calm rest of things."

Newton explains that he does not define time, space, place, and motion, because they are "well known to all." But he observes that men commonly "conceive these quantities under no other notions but from the relation they bear to sensible objects." He finds it necessary, therefore, to distinguish each of them "into absolute and relative, true and apparent, mathematical and common."

By "absolute, true, and mathematical time," Newton means that which "of itself, and from its own nature, flows equably without relation to anything external, and by another name is called duration." In contrast, "relative, apparent, and common time, is some sensible and external (whether accurate or unequable) measure of duration by the means of motion, which

is commonly used instead of true time, such as an hour, a day, a month, a year." In astronomy, Newton points out, absolute time "is distinguished from relative, by the equation or correction of the apparent time. For the natural days are truly unequal, though they are commonly considered as equal, and used for measures of time; astronomers correct this inequality that they may measure the celestial motions by a more accurate time."

Newton seems to be saying that time measures motion and also that it is measured by it. If his distinction between absolute and relative time is ignored, his theory of time does not appear to be very different from that of Aristotle, who says, "not only do we measure the movement by the time, but also the time by the movement." Insofar as movement or change involves a sequence in which one part comes after another, time measures it by numbering the *before*s and *after*s. But we also judge the length of the time according to the duration of the movement, and in this sense the movement measures time.

As both Aristotle and Augustine point out, time measures rest as well as motion, for, in Aristotle's words, "all rest is in time. . . . Time is not motion, but the 'number of motion' and what is at rest can be in the number of motion. Not everything that is not in motion can be said to be 'at rest'—but only that which can be moved, though it actually is not moved."

But where Aristotle, in defining time as the measure of motion or rest, makes time an attribute of movement, Newton regards absolute time as the perfect measure of motion precisely because its nature is independent of all physical change. Only relative time depends on motion, and that is the time which is measured by motion, not the measure of it. Those "who confound real quantities with their relations and sensible measures," Newton declares, "defile the purity of mathematical and philosophical truths."

Distinguishing between duration and time, Locke expresses in another way the difference between Newton and Aristotle. Time for Locke is that portion of duration which consists of definite periods and is measured by the motion of bodies. "We must, therefore, carefully distinguish betwixt duration itself, and the meas-

ures we make use of to judge its length. Duration in itself is to be considered as going on in one constant, equal uniform course; but none of the measures which we make use of, can be known to do so." It seems wrong to Locke to define time as the measure of motion when, on the contrary, it is motion—"the motion of the great and visible bodies of the world"—which measures time.

What Locke calls "duration" seems to be the same as Newton's absolute time. It is in no way relative to the existence of bodies or motion. Just as space or, as he calls it, "expansion," is not limited by matter, so duration is not limited by motion. As place is that portion of infinite space "which is possessed by and comprehended within the material world, and is thereby distinguished from the rest of expansion," so time is "so much of infinite duration, as is measured by, and coexistent with, the existence and motions of the great bodies of the universe."

MANY ISSUES ARE RAISED by absolute time or infinite duration conceived as independent of all bodily motions. Einstein, for example, challenges the classical notion of simultaneity, according to which two events taking place a great distance from one another are said to occur *at the same time*, that is, at the same moment in the absolute flow of time.

"Before the advent of the theory of relativity," he writes, "it had always been tacitly assumed in physics that the statement of time had an absolute significance, *i.e.*, that it is independent of the state of motion of the body of reference." But if the world of physical events is a four-dimensional manifold in which the time coordinate is always associated with the space coordinates for any reference-body under observation, then "every reference-body (coordinate system) has its own particular time"; and, Einstein adds, "unless we are told the reference-body to which the statement of time refers, there is no meaning in a statement of the time of an event."

There is also the issue of the emptiness of that part of absolute time or infinite duration which comes before or after the existence of the world, comparable to the issue concerning the void or empty space beyond the borders of the material universe. Those who regard time as

relative to and inseparable from motion deny the possibility of such empty time.

For Plato, as for Christian theologians like Augustine and Aquinas, time itself is created with the creation of the heavenly bodies and their motions. As the story of the world's becoming is told in the *Timaeus*, the maker "resolved to have a moving image of eternity, and when he set in order the heaven, he made this image eternal but moving according to number, while eternity itself rests in unity; and this image we call time. . . . Time, then, and the heaven came into being at the same instant."

Augustine undertakes to answer "those who agree that God is the Creator of the world, but have difficulties about the time of its creation." He asserts that "there is no time before the world. For if eternity and time are rightly distinguished by this, that time does not exist without some movement and transition, while in eternity there is no change, who does not see that there could have been no time had not some creature been made, which by some motion could give birth to change. . . . I do not see," Augustine continues, "how God can be said to have created the world after spaces of time had elapsed, unless it be said that prior to the world there was some creature by whose movement time could pass." But the existence of a creature prior to creation is impossible. Hence Augustine concludes that "if in the world's creation change and motion were created," then "the world and time were simultaneously created."

Though the existence of a creature prior to creation is impossible, it is not impossible, according to Aquinas, for the created world to be coeval with its Creator. While he rejects the opinion of those who assert that the world now exists without any dependence on God, and who deny that it was ever made by God, he entertains, as possible, the view that "the world has a beginning, not of time, but of creation." Those who hold this view, he explains, mean that "it was always made. . . . For just as, if a foot were always in the dust from eternity, there would always be a footprint which without doubt was caused by him who trod on it, so also the world always was, because its Maker always existed."

It does not necessarily follow, Aquinas ad-

mits, that "if God is the active cause of the world, He must be prior to the world in duration, because creation, by which He produced the world, is not a successive change." But Aquinas does not think that the question whether the world and time began with creation or has always co-existed with its Creator, can be resolved by reason. "The newness of the world," he says, "is known only by revelation. . . . That the world did not always exist we hold by faith alone; it cannot be proved demonstratively." In saying this, he is not unmindful of the fact that Aristotle advances arguments to show that there can be no beginning to either time or motion. "Since time cannot exist and is unthinkable apart from the moment, and the moment is a kind of middle point, uniting as it does in itself both . . . a beginning of future time and an end of past time, it follows that there must always be time. . . . But if this is true of time, it is evident that it must also be true of motion, time being an attribute of motion."

With one exception, all his predecessors, according to Aristotle, are in agreement that time is uncreated. "In fact," he says, "it is just this that enables Democritus to show that all things cannot have had a becoming. . . . Plato alone asserts the creation of time, saying that it had a becoming together with the universe." But Aristotle's own arguments for the eternity of time and motion do not seem to Aquinas to be "absolutely demonstrative, but only relatively so—viz., as against the arguments of some of the ancients who asserted that the world began to be in some actually impossible ways." As for the present moment, or the *now* of time, always requiring something which comes *before* as well as *after*, Aquinas admits that "time cannot be made except according to some *now*," yet "not because there is time in the first *now*, but because from it time begins."

The position of Aquinas, that arguments for the initiation or the endlessness of time are only dialectical, seems to be confirmed by Kant. In the Transcendental Dialectic of the *Critique of Pure Reason*, Kant sets forth as one of the cosmological antinomies the opposed arguments for the beginning of the world and for a world without beginning. The reasoning on either side being equal in its *appearance* of cogency, nei-

ther conclusion, according to Kant, is genuinely demonstrated.

But those who, like Newton and Locke, separate absolute time or infinite duration from the existence of a world in motion, seem to be unaffected by arguments which concern only the time of the material world, the time that is relative to motion. For them, absolute or infinite time is eternity. It may be empty of motion, but it is filled with God's everlasting being. "Though we make duration boundless, as certainly it is," Locke writes, "we cannot yet extend it beyond all being. God, every one easily allows, fills eternity." God is not eternity, says Newton, but He is eternal. "His duration reaches from eternity to eternity. . . . He endures forever, and is everywhere present; and, by existing always and everywhere, He constitutes duration and space."

The issue is again brought into focus by the denial that God's eternity can be identified with infinite or absolute time. "Even supposing that the world always was," Aquinas writes, it would not be eternal in the sense in which God is, "for the divine being is all being simultaneously without succession." He distinguishes "the *now* that stands still" as the eternal present from the continually shifting *now* in the flow of time's passing moments. For him God's everlasting being does not endure through endless time, but rather exists unchanging in the eternal present. "As eternity is the proper measure of being, so time is the proper measure of movement; and hence," Aquinas writes, "according as any being recedes from permanence in being, and is subject to change, it recedes from eternity and is subject to time."

THE TWO MEANINGS OF eternity—infinite time and utter timelessness—are discussed in the chapter on ETERNITY. The distinction between time and eternity, which is considered both there and here, seems to be understood differently by those who contrast timelessness with temporality and by those who equate eternity with endless time. For the latter, the point of difference between eternity and time seems to be only one of infinite as opposed to limited duration. Yet, as we have just observed, writers like Newton and Locke also distinguish absolute or infinite time (which they tend to iden-

tify with eternity) from definite periods or limited spans of time, by making the one independent of, the other relative to and measured by, motion.

The question remains whether absolute time is real time or only a mathematical abstraction, whether it exists apart from perceived time—the experienced duration of observable motions or the elapsed time of events in succession.

Considering this question, Kant says that "those who maintain the absolute reality of time and space, whether as essentially subsisting, or only inhering, as modifications in things, must find themselves at utter variance with the principles of experience itself. For, if they decide for the first view, and make space and time into substances, this being the side taken by mathematical natural philosophers, they must admit two self-subsisting nonentities, infinite and eternal, which exist (yet without their being anything real) for the purpose of containing in themselves everything that is real. If they adopt the second view of inherence, which is preferred by some metaphysical natural philosophers, and regard space and time as relations . . . abstracted from experience . . . they find themselves in that case necessitated to deny the validity of mathematical doctrine *a priori* in reference to real things."

On Kant's own view, the synthetic judgments of mathematics can have the apodictic certainty of *a priori* propositions only if space and time are themselves *a priori* forms of intuition. As the *a priori* form of space makes possible the pure science of geometry, according to Kant, so the *a priori* form of time makes possible the pure science of numbers, *i.e.*, arithmetic. But whereas "space, as the pure form of external intuition is limited . . . to external phenomena alone," time, as "the form of the internal sense," is for Kant "the formal condition *a priori* of all phenomena whatsoever."

Without sharing Kant's theory of *a priori* forms of intuition, or of the foundations of pure mathematics, other writers appear to agree to some extent with his denial of independent reality to time. Aristotle raises the question "whether if soul did not exist, time would exist or not." He thinks the question may be fairly asked because "if there cannot be someone to count, there cannot be anything that can be

counted, so that evidently there cannot be number"—for number is the counted or the countable. "But if nothing but soul, or in soul reason, is qualified to count, there would not be time unless there were soul." Yet Aristotle qualifies this somewhat by adding that "if *movement* can exist without soul, and the before and after are attributes of movement," time may exist as "these *qua* numerable."

Augustine takes a less qualified position. Asking what it is that time is the "extendedness of," he answers: "Probably of the mind itself." Insisting that neither future nor past time can be measured because neither exists, Augustine concludes that it is only passing time we can measure, and that we can measure it only in the mind. "It is in you, O my mind," he says, "that I measure time. . . . What I measure is the impress produced in you by things as they pass and abiding in you when they have passed . . . I do not measure the things themselves whose passage produced the impress; it is the impress that I measure when I measure time."

Yet William James, while giving a similar analysis of our experience of time, insists that time is objective as well as subjective. Time and space relations, he writes, "*are* impressed from without." The time and space in which the objects of our thought exist, exist as independently of the mind as do those objects themselves. "*The time- and space-relations between things do stamp copies within*"; as, for example, when "things sequent in time impress their sequence on our memory."

WILLIAM JAMES PROPOSES a solution of the mystery of how time exists—at least how it exists in experience. So far as our experience goes, past and future can exist only in the present. But how can these extended parts of time exist in the present if the present is but a fleeting moment, without any extent of duration, "gone," as James says, "in the instant of becoming"? His answer is in terms of something he calls "the specious present."

Unlike the real present, the specious present is "no knife-edge but a saddle-back, with a certain breadth of its own on which we sit perched, and from which we look in two directions into time. The unit of composition of our perception of time is a *duration*, with a bow and a

stern, as it were—a rearward- and a forward-looking end. It is only as parts of this *duration-block* that the relation of *succession* of one end to the other is perceived."

On the basis of some experimental evidence, James estimates that the specious present may vary in length "from a few seconds to probably not more than a minute." It has "a vaguely vanishing backward and forward fringe; but its nucleus is probably the dozen seconds or less that have just elapsed."

The irreversible flow of time—the succession of moments which constitute the motion of the future through the present into the past—occurs in the specious present, though not, according to James, without the accompaniment of observed or experienced change. "Awareness of *change* is . . . the condition on which our perception of time's flow depends." But that awareness must take place in the specious present "with its content perceived as having one part earlier and the other part later." In consequence, James considers the specious present to be, not only "the original intuition of time," but also "*the original paragon prototype of all conceived times.*"

THE PROBLEMS OF TIME, its own process and being as well as its relation to all other existence and change, its character as an aspect of experience and as an object of thought, seem to belong to many subject matters—to psychology and to experimental or mathematical physics, to the philosophy of nature, metaphysics, and theology.

For some thinkers—in our own time notably Bergson, Whitehead, and Dewey—the concept of time, of the burgeoning future, of the continuum of events, seems to determine a whole philosophical outlook. If it is not equally decisive throughout the tradition of the great books, it is at least of critical significance in speculations about the origin and end of the world, in the contrast between physical and spiritual modes of being, in the consideration of the processes of life, thought, and feeling, and in the analysis of more inclusive concepts, such as that of order.

The temporal relationships of succession and simultaneity, for example, may be the source from which we derive the notions of prior, pos-

terior, and simultaneous, but they are traditionally viewed as exemplifying rather than exhausting these types of order. When Augustine deals with the perplexing theological question of the priority of eternity to time, he finds it necessary to distinguish "priority in eternity, priority in time, priority in choice, priority in origin."

When Aristotle deals with metaphysical questions concerning the order of cause and effect, of potentiality and actuality, of essence and accident, he differentiates between temporal and logical priority, and between priority in thought and priority in nature. When Harvey tries to solve the familiar biological riddle (which came first, the chicken or the egg?), he also finds his solution in a distinction. "The fowl is prior by nature," he writes, "but the egg is prior in time."

Space and spatial relationships, no less than time and the temporal, figure in the general analysis of order or relatedness and have a bearing on other problems in physics and philosophy. But in addition to time's having more significance than space for the theologian, time also has peculiar importance for one subject matter in which space is of much less concern, namely, history and the philosophy of history.

Besides the general view which the historian takes of time as the locus of history, or the medium in which the pattern of history unfolds, the writer of history usually employs certain conventional time divisions to mark the major phases or epochs of the story he has to tell. Clocks and calendars record or represent the passage of time in conventional units, but these conventions have some natural basis in astronomical time, solar or sidereal. In contrast, the distinction between historic and prehistoric time, or the division of history into such periods as ancient, mediaeval, and modern, seems to be purely a matter of social or cultural convention.

With Hegel, however, the division of the whole of history into three epochs, and of each epoch again into three periods, follows from the dialectical triad of thesis, antithesis, and synthesis which is the indwelling form of history's development. The division of each of the three phases of world-history—the Oriental, the Grae-

co-Roman, and the German worlds—into a first, second, and third period produces in each case the same pattern of origin, conflict, and resolution. For the most part, Hegel does not identify these three periods with ancient, mediaeval, and modern times; yet in one case, that of the German world, he does refer to the second period as "the middle ages" and the third as "the modern time."

Such words as "ancient" and "modern" have conventional significance for most historians. Furthermore, the meanings of modernity and antiquity are themselves subject to historical relativity. In the tradition of the great books, this appears most plainly in the references made to ancients and moderns by writers whom we today classify as ancient and mediaeval.

Thucydides, for example, begins his history with a description of what is for him the antiquity of Greece. Nicomachus opens his *Introduction to Arithmetic* with a remark about "the ancients, who under the leadership of Pythagoras first made science systematic, defined philosophy as the love of wisdom." Mathematics, Aristotle says, "has come to be identical with philosophy for modern thinkers."

In another place, Aristotle contrasts "the thinkers of the present day" with "the thinkers of old"; and in still another he speaks of "ancient and truly traditional theories." Like Aristotle in the sphere of thought, so Tacitus in the sphere of politics frequently compares ancient and modern institutions or practices.

In the Middle Ages, Aquinas speaks of the "teachings of the early philosophers" and, as frequently as Aristotle, he refers to ancient and modern doctrines. In the Renaissance, Kepler treats as ancient a scientist who, in point of time, comes much later than those whom Aristotle and Aquinas call modern. Classifying three schools of astronomical thought, he distinguishes an ancient one, which had "Ptolemy as its coryphaeus," from two modern ones, respectively headed by Copernicus and Tycho Brahe.

Such references, which have occurred in all three periods of the western tradition, suggest the probability that at some future date the whole tradition with which we are now acquainted will be referred to as the thought and culture of ancient times.

OUTLINE OF TOPICS

	PAGE
1. The nature of time: time as duration or as the measure of motion; time as a continuous quantity; absolute and relative time	905
2. The distinction between time and eternity: the eternity of endless time distinguished from the eternity of timelessness and immutability	906
2a. Aeviternity as intermediate between time and eternity	
2b. Arguments concerning the infinity of time and the eternity of motion or the world	
2c. The creation of time: the priority of eternity to time; the immutability of the world after the end of time	907
3. The mode of existence of time	
3a. The parts of time: its division into past, present, and future	
3b. The reality of the past and the future in relation to the existence of the present	908
3c. The extent of the present moment: instantaneity	
4. The measurement of time: sun, stars, and clocks	
5. Temporal relationships: time as a means of ordering	
5a. Simultaneity or coexistence: the simultaneity of cause and effect, action and passion, knowledge and object known	
5b. Succession or priority and posteriority: the temporal order of cause and effect, potentiality and actuality	909
5c. Succession and simultaneity in relation to the association of ideas	
5d. Comparison of temporal with non-temporal simultaneity and succession: the prior in thought, by nature, or in origin	
6. The knowledge of time and the experience of duration	
6a. The perception of time by the interior senses: the difference between the experience and memory of time intervals	
6b. Factors influencing the estimate of time elapsed: empty and filled time; illusions of time perception; the variability of experienced durations	910
6c. Time as a transcendental form of intuition: the <i>a priori</i> foundations of arithmetic; the issue concerning innate and acquired time perception	
6d. The signifying of time: the distinction between noun and verb; the tenses of the verb	
6e. Knowledge of the past: the storehouse of memory; the evidences of the past in physical traces or remnants	
6f. Knowledge of the future: the truth of propositions about future contingents; the probability of predictions	
7. The temporal course of the passions: emotional attitudes toward time and mutability	911
8. Historical time	912
8a. Prehistoric and historic time: the antiquity of man	
8b. The epochs of history: myths of a golden age; the relativity of modernity	

REFERENCES

To find the passages cited, use the numbers in heavy type, which are the volume and page numbers of the passages referred to. For example, in 4 HOMER *Iliad* BK II [265-283] 12d, the number 4 is the number of the volume in the set; the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS. When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES *Psychology* 116a-119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page; the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO *Symposium* 163b-164c, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS. One or more of the main divisions of a work (such as PART, BK, CH, SECT.) are sometimes included in the reference line numbers in brackets; are given in certain cases, e.g. *Iliad* BK II [265-283] 12d.

BIBLICAL REFERENCES. The references are to book, chapter, and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay indicated by a (D) follows, e.g. OLD TESTAMENT *Nehemiah* 7:45 (D) *H I dras* 7:46.

SYMBOLS. The abbreviation esp. calls the reader's attention to one or more especially relevant parts of a whole reference; passim signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style; for general guidance in the use of *The Great Idea*, consult the Preface.

Chapter 94: TRUTH

INTRODUCTION

NOT everyone knows Josiah Royce's definition of a liar as a man who willfully misplaces his ontological predicates, but everyone who has ever told a lie will recognize its accuracy. To restate the definition less elegantly, lying consists in saying the contrary of what one thinks or believes. To speak truthfully we must make our speech conform to our thought, we must say that something is the case if we think it is, or that it is not, if we think it is not. If we deliberately say "is" when we think *is not*, or say "is not" when we think *is*, we lie.

Of course, the man who speaks truthfully may in fact say what is false, just as the man whose intent is to falsify may inadvertently speak the truth. The intention to speak one's mind does not guarantee that one's mind is free from error or in possession of the truth. Herein lies the traditional distinction between truth as a social and as an intellectual matter. What Dr. Johnson calls *moral* truth consists in the obligation to say what we mean. In contrast what he calls *physical* truth depends not on the veracity of what we say but on the validity of what we mean.

The theory of truth in the tradition of the great books deals largely with the latter kind of truth. The great issues concern whether we can know the truth and how we can ever tell whether something is true or false. Though the philosophers and scientists, from Plato to Freud, seem to stand together against the extreme sophistry or skepticism which denies the distinction between true and false or puts truth utterly beyond the reach of man, they do not all agree on the extent to which truth is attainable by men, on its immutability or variability, on the signs by which men tell whether they have the truth or not, or on the causes of error and the means for avoiding falsity.

Much that Plato thinks is true Freud rejects

as false. Freud searches for truth in other quarters and by other methods. But the ancient controversy in which Socrates engages with the sophists of his day, who were willing to regard as true whatever anyone wished to think, seems to differ not at all from Freud's quarrel with those whom he calls "intellectual nihilists." They are the persons who say there is no such thing as truth or that it is only the product of our own needs and desires. They make it "absolutely immaterial," Freud writes, "what views we accept. All of them are equally true and false. And no one has a right to accuse anyone else of error."

Across the centuries the arguments against the skeptic seem to be the same. If the skeptic does not mind contradicting himself when he tries to defend the truth of the proposition that all propositions are equally true or false, he can perhaps be challenged by the fact that he does not act according to his view. If all opinions are equally true or false, then why, Aristotle asks, does not the denier of truth walk "into a well or over a precipice" instead of avoiding such things. "If it were really a matter of indifference what we believed," Freud similarly argues, "then we might just as well build our bridges of cardboard as of stone, or inject a tenth of a gramme of morphia into a patient instead of a hundredth, or take tear-gas as a narcotic instead of ether. But," he adds, "the intellectual anarchists themselves would strongly repudiate such practical applications of their theory."

Whether the skeptic can be refuted or merely silenced may depend on a further step in the argument, in which the skeptic substitutes probability for truth, both as a basis for action and as the quality of all our opinions about the real world. The argument takes different forms according to the different ways in which probability is distinguished from truth or according

to the distinction between a complete and limited skepticism. Montaigne, for example, seems to think that the complete skeptic cannot even acknowledge degrees of probability to be objectively ascertainable without admitting the criterion of truth, whereas Hume, defending a mitigated skepticism, offers criteria for measuring the probability of judgments about matters of fact.

THE POSITION OF THE skeptic, in its bearing on truth and probability, is discussed in the chapters on KNOWLEDGE and OPINION. Here we shall proceed to other controversial questions concerning truth. But we must first observe that there is one major question which does not seem to cause much dispute. Not only do the great authors (with the possible exception of Montaigne and Hume) seem to be unanimous in their conviction that men can attain and share the truth—at least some truths—but they also appear to give the same answer to the question, What is truth?

The apparently unanimous agreement on the nature of truth may seem remarkable in the context of the manifold disagreements in the great books concerning what is true. As already indicated, some of these disagreements occur in the theory of truth itself—in divergent analyses of the sources of error, or in conflicting formulations of the signs of truth. But even these differences do not affect the agreement on the nature of truth. Just as everyone knows what a liar is, but not as readily whether someone is telling a lie, so the great philosophers seem able to agree on what truth is, but not as readily on what is true. That the definitions—of lying and of truth—are intimately connected will be seen from Plato's conception of the nature of truth as a correspondence between thought and reality. If truthfulness, viewed socially, requires a man's words to be a faithful representation of his mind, truth in the mind itself (or in the statements which express thought) depends on their conformity to reality.

A false proposition, according to Plato, is "one which asserts the non-existence of things which are, and the existence of things which are not." Since "false opinion is that form of opinion which thinks the opposite of the truth," it necessarily follows, as Aristotle points

out, that "to say of what is that it is, and of what is not that it is not, is true," just as it is false "to say of what is that it is not, or of what is not that it is."

In one sense, the relation between a true statement and the fact it states is reciprocal. "If a man is," Aristotle declares, then "the proposition in which we allege that he is, is true; and conversely, if the proposition wherein we allege that he is, is true, then he is." But the true proposition "is in no way the cause of the being of the man," whereas "the fact of the man's being does seem somehow to be the cause of the truth of the proposition, for the truth or falsity of the proposition depends on the fact of the man's being or not being."

THIS SIMPLE STATEMENT about the nature of truth is repeated again and again in the subsequent tradition of western thought. What variation there is from writer to writer seems to be in phrasing alone, though the common insight concerning truth as an agreement or correspondence between the mind and reality may occur in the context of widely varying conceptions concerning the nature of the mind and of reality or being.

Plotinus may be an exception, insofar as his theory of knowledge involves a relation of identity rather than of mere correspondence. "The object known," he writes, "must be identical with the knowing act . . . If this identity does not exist, neither does truth . . . Truth cannot apply to something conflicting with itself; what it affirms it must also be."

But others, like Augustine, Aquinas, Descartes, and Spinoza, adopt the conception of truth as an agreement between the mind and reality. Falsehood occurs, says Augustine, when "something is thought to be which is not." According to Aquinas, "any intellect which understands a thing to be otherwise than it is, is false." Truth in the human intellect consists "in the conformity of the intellect with the thing." The same point is implied, at least, in Descartes' remark that if we do not relate our ideas "to anything beyond themselves, they cannot properly speaking be false." Error or, for that matter, truth can only arise in "my judging that the ideas which are in me are similar or conformable to the things which are out-

side me." Spinoza states it as an axiom rather than a definition that "a true idea must agree with that of which it is the idea."

Making a distinction between verbal and real truth, Locke writes: "Though our words signify nothing but our ideas, yet being designed by them to signify things, the truth they contain, when put into propositions, will be only verbal, when they stand for ideas in the mind that have not an agreement with the reality of things." Precisely because he considers truth to consist "in the accordance of a cognition with its object," Kant holds that, so far as the content (as opposed to the form) of a cognition is concerned, it is impossible to discover a universal criterion of truth.

We shall return to Kant's point in a subsequent discussion of the signs of truth, as also we shall have occasion to return to Locke's distinction between real and verbal truth. Neither affects the insight that truth consists in the agreement of our propositions or judgments with the facts they attempt to state, unless it is the qualification that truth so defined is real, not verbal.

In his Preface to *The Meaning of Truth*, James comments on the excitement caused by his earlier lectures on pragmatism, in which, offering the pragmatist's conception of truth, he had spoken of an idea's "working successfully" as the sign of its truth. He warns his critics that this is not a new definition of the nature of truth, but only a new interpretation of what it means to say that the truth of our ideas consists in "their agreement, as falsity means their disagreement, with reality. Pragmatists and intellectualists," he adds, "both accept this definition as a matter of course.

"To agree in the widest sense with reality," James then explains, "can only mean to be guided either straight up to it or into its surroundings, or to be put into such working touch with it as to handle either it or something connected with it better than if we disagreed. Better either intellectually or practically . . . Any idea that helps us to deal, whether practically or intellectually, with either the reality or its belongings . . . that *fits*, in fact, and adapts our life to the reality's whole setting, will agree sufficiently to meet the requirement. It will be true of that reality."

Without enlarging on its meaning as James does, Freud affirms that the ordinary man's conception of truth is that of the scientist also. Science, he says, aims "to arrive at correspondence with reality, that is to say with what exists outside of us and independently of us. . . . This correspondence with the real external world we call truth. It is the aim of scientific work, even when the practical value of that work does not interest us."

THE DEFINITION OF TRUTH as the agreement of the mind with reality leaves many problems to be solved and further explanations to be given by those who accept it. As James indicates, the theory of truth begins rather than ends with its definition. How do we know when our ideas--our statements or judgments--correspond with reality? By what signs or criteria shall we discover their truth or falsity? To this question the great books give various answers which we shall presently consider. There are other problems about the nature of truth which deserve attention first.

For example, one consequence of the definition seems to be that truth is a property of ideas rather than of things. Aristotle says that "it is not as if the good were true and the bad were in itself false"; hence "falsity and truth are not in things . . . but in thought." Yet he also applies the word "false" to non-existent things or to things whose appearance somehow belies their nature. Aquinas goes further. He distinguishes between the sense in which truth and falsity are primarily in the intellect and secondarily in things.

The equation between intellect and thing, he points out, can be looked at in two ways, depending on whether the intellect is the cause of the thing's nature, or the nature of the thing is the cause of knowledge in the intellect. When "things are the measure and rule of the intellect, truth consists in the equation of the intellect to the thing. . . . But when the intellect is the rule or measure of things, truth consists in the equation of things to the intellect"—as the product of human art may be said to be true when it accords with the artist's plan or intention. Thus "a house is said to be true that fulfills the likeness of the form in the architect's mind."

But, according to Aquinas, not only artificial things, but natural things as well, can have truth when they are viewed in relation to the intellect on which they depend. The divine intellect which is the creative cause of natural things measures their truth, as the human intellect measures the truth of artificial things. "Natural things are said to be true," Aquinas writes, "in so far as they express the likeness of the ideas that are in the divine mind; for a stone is called true, which possesses the nature proper to a stone, according to the preconception in the divine intellect."

Aquinas' conclusion—that "truth resides primarily in the intellect and secondarily in things according as they are related to the intellect as their source"—at once suggests the profound difference between truth in the divine and in the human intellect. The difference is more than that between infinite and finite truth. The distinction between uncreated and created truth affects the definition of truth itself.

The definition of truth as an equation of thought to thing, or thing to thought, does not seem to hold for the divine intellect. The notion of "conformity with its source," Aquinas acknowledges, "cannot be said, properly speaking, of divine truth." Divine truth has no source. It is not truth by correspondence with anything else. Rather it is, in the language of the theologian, the "primal truth." "God Himself, Who is the primal truth . . . is the rule of all truth," and "the principle and source of all truth."

IN THE HUMAN SPHERE, the definition of truth seems to be differently interpreted according as truth is made a property of words or of ideas. "To form a clear notion of truth," Locke writes, "it is very necessary to consider truth of thought and truth of words distinctly from one another." The truth of signs, or what is sometimes called "truth of signification," is "nothing but the joining or separating of words in propositions as the ideas they stand for agree or disagree in men's minds." In contrast to such verbal truth, what Locke calls mental truth consists in the joining or separating of our ideas themselves in a manner to accord with the realities they represent.

For Locke, verbal truth is "chimerical" or "barely nominal" because it can exist without any regard to "whether our ideas are such as really have, or are capable of having, an existence in nature." The signs we use may truly represent our thought even though what we think or state in words is false in fact. Hobbes takes a somewhat contrary view. "True and false," he writes, "are attributes of speech, not of things. And where speech is not, there is neither truth nor falsehood."

What is the cause of truth in speech? Hobbes replies that, since it consists "in the right ordering of names in our affirmations," a man needs only "to remember what every name he uses stands for." If men begin with definitions or "the settling of significations," and then abide by their definitions in subsequent discourse, their discourse will have truth. From want of definitions or from wrong definitions arise "all false and senseless tenets."

Agreement with reality would seem to be the measure of truth for Hobbes only to the extent that definitions can be right or wrong by reference to the objects defined. If definitions themselves are merely nominal and have rightness so far as they may be free from contradiction, then truth tends to become, more than a property of speech, almost purely logistical—a matter of playing the game of words according to the rules. Reasoning is reckoning with words. It begins with definitions and if it proceeds rightly, it produces "general, eternal and immutable truth. . . . For he that reasoneth aright in words he understandeth, can never conclude in error."

Hobbes' position seems to have a bearing not only on the issue concerning verbal and real truth, but also on the question whether the logical validity of reasoning makes the conclusion it reaches true as a matter of fact. Some writers, like Kant, distinguish between the truth which a proposition has when it conforms to the rules of thought and the truth it has when it represents nature. Valid reasoning alone cannot guarantee that a conclusion is true in fact. That depends on the truth of the premises—upon their being true of the nature of things. Aristotle criticizes those who, accepting certain principles as true, "are ready to accept any consequence of their application.

As though some principles," he continues, "did not require to be judged from their results, and particularly from their final issue. And that issue . . . in the knowledge of nature is the unimpeachable evidence of the senses as to each fact."

BUT NOT ALL TRUTH may require or admit of such certification. The truths of mathematics may be different from those of physics or metaphysics, and those of philosophy or religion from those of the empirical natural sciences. It is sometimes supposed, for example, that the truths of mathematics are purely formal or without reference to real existence. That seems to be the position of Hobbes and Hume, both of whom take geometry as the model of truth. For them statements of fact about real existence are at best probable opinions. For others, like James, there can be truth in the natural sciences, but such empirical truth is distinct in type from what he calls the "necessary" or "*a priori*" truths of mathematics and logic.

Does the definition of truth as agreement with reality apply to all kinds of truth, or only to truths about the realm of nature? The question has in mind more than the distinction between mathematics and physics. It is concerned with the difference between the study of nature and the moral sciences, or between the theoretic and the practical disciplines. "As regards nature," writes Kant, "experience presents us with rules and is the source of truth," but not so in ethical matters or morality. A theoretic proposition asserts that something exists or has a certain property, and so its truth depends on the existence of the thing or its real possession of an attribute; but a practical or moral judgment states, not what is, but what should occur or ought to be. Such a judgment cannot be true by correspondence with the way things are. Its truth, according to Aristotle, must consist rather "in agreement with right desire."

On this theory, all that remains common to speculative and practical truth is the conformity of the intellect to something outside itself—to an existing thing or to desire, will, or appetite. Stressing the difference, Aquinas declares that "truth is not the same for the practical as for the speculative intellect." The "conformity

with right appetite" upon which practical truth depends, he goes on to say, "has no place in necessary matters, which are not effected by the human will, but only in contingent matters which can be effected by us, whether they be matters of interior action or the products of external work." In consequence, "in matters of action, truth or practical rectitude is not the same for all as to what is particular, but only as to the common principles"; whereas in speculative matters, concerned chiefly with necessary things, "truth is the same for all men, both as to principles and as to conclusions."

THE PROBLEM OF THE criteria or signs of truth does not seem to be of equal concern to all who discuss the nature of truth. For the ancients, at one extreme, it seems to be hardly a problem at all. For William James, at the other extreme, it seems to be the central problem. In the controversy over the pragmatic theory of truth, in which James engages with Bradley and Russell, some confusion tends to result from the fact that James seldom discusses what truth is except in terms of how we know what is true, while his opponents often ignore the signs of truth in discussing its nature. The important point for James is not that truth consists in agreement with reality, but that "true ideas are those we can assimilate, validate, corroborate, and verify." Whether we can assimilate or validate or verify an idea in turn depends upon its consequences, either for thought or action, or what James calls "truth's cash-value in experiential terms."

In his *Psychology*, James suggests another aspect of his theory of the expediency of a true idea, which he later developed in *Pragmatism*. Not only must our conceptions or theories be "able to account satisfactorily for our sensible experience," but they are also to be weighed for their appeal "to our aesthetic, emotional, and active needs." Apart from this added criterion, which became the subject of much dispute, the pragmatic theory of truth represents one of the traditional solutions of the problem of how to tell whether something is true or false. It looks mainly to extrinsic signs—not to some feature of the idea or thought itself, but to its consequences.

"The test of real and vigorous thinking,"

writes J. S. Mill, "the thinking which ascertains truths instead of dreaming, is successful application to practice." In similar vein, Bacon says that "of all the signs there is none more certain or worthy than that of the fruits produced, for the fruits and effects are the sureties and vouchers, as it were, for the truth of philosophy." The man who supposes that the end of learning lies in contemplation of the truth will "propose to himself as the test of truth, the satisfaction of his mind and understanding, as to the causes of things long since known." Only those who recognize that "the real and legitimate goal of the sciences is the endowment of human life with new inventions and riches," will submit truth to the test of its leading "to some new earnest of effects." To take effects as "pledges of truth" is, for Bacon, equivalent to declaring that truth and utility are "perfectly identical."

Verification by appeal to observation or sensible evidences may be regarded as one way of testing the truth of thought in terms of its consequences, but it also involves the principle of contradiction as a criterion of truth. When Aristotle recommends, for example, that we should accept theories as true "only if what they affirm agrees with the observed facts," he is saying that when the truth of a particular perception is indisputable, because the observed fact is evident, the general or theoretical statement which it contradicts must be false.

But the principle of contradiction as a criterion of truth goes further than testing theories by their consistency with observation. One of two contradictory statements must be false and the other must be true "if that which it is true to affirm is nothing other than that which it is false to deny." Even a single statement may show itself false by being self-contradictory, and in consequence its opposite can be seen to be true. What Aristotle calls axioms, or self-evident and indisputable truths, are those propositions immediately known to be true, and necessarily true, because their contradictories, being self-contradictory, are impossible statements, or necessarily false. The truth of any proposition which is neither a self-evident axiom nor the statement of an evident, perceived fact, is tested, according to the principle of contradiction, by its consistency with axioms or perceptions.

As opposed to consequences or effects, contradiction or consistency as a sign of truth seems to be an intrinsic criterion. But this criterion is not universally accepted. "Contradiction," writes Pascal, "is not a sign of falsity, nor the want of contradiction a sign of truth." Nor, even when accepted, is it always judged adequate to solve the problem. It is, for Kant, a "merely logical criterion of truth . . . the *conditio sine qua non*, or negative condition of all truth. Farther than this logic cannot go, and the error which depends not on the form, but on the content of the cognition, it has no test to discover."

Some thinkers seem to rely upon an intrinsic mark by which each idea reveals its own truth or falsity. Augustine, for example, considers by what criterion he would know whether what Moses said was true. "And if I did know it," he asks, "would it be from him that I knew it? No," he replies, "but within me, in the inner retreat of my mind, the Truth, which is neither Hebrew nor Greek, nor Latin nor Barbarian, would tell me, without lips or tongue or sounded syllables: 'He speaks truth.'"

For Augustine, God is the warranty of the inner voice which plainly signifies the truth. For Spinoza, the truth of an idea depends upon its relation to God. Because "a true idea in us is that which in God is adequate, in so far as He is manifested by the nature of the human mind," it follows, according to Spinoza, that "he who has a true idea knows at the same time that he has a true idea, nor can he doubt the truth of the thing"; for "he who knows a thing truly must at the same time have an adequate idea or a true knowledge of his knowledge, that is to say (as is self-evident) he must be certain."

It is impossible, Spinoza maintains, to have a true idea without at the same time knowing that it is true. To the question, "How can a man know that he has an idea which agrees with that of which it is the idea?" he replies that "he knows it simply because he has an idea which agrees with that of which it is the idea, that is to say, because truth is its own standard." For what can be clearer, Spinoza asks, "or more certain than a true idea as the standard of truth? Just as light reveals both itself and the darkness, so truth is the standard of itself and of the false."

Spinoza defines an adequate idea as one which, "in so far as it is considered in itself, without reference to the object, has all the properties or internal signs of a true idea." He explains, moreover, that by "internal" he means to exclude even "the agreement of the idea with its object." This, he thinks, meets the objection that "if a true idea is distinguished from a false idea only in so far as it is said to agree with that of which it is the idea, the true idea [would have] no reality or perfection above the false idea (since they are distinguished by an external sign alone), and consequently the man who has true ideas will have no greater reality or perfection than he who has false ideas only."

Although Descartes and Locke also employ an intrinsic criterion of truth—not the adequacy, but the clarity and distinctness, of ideas—they do not seem to mean, as Spinoza does, that a single idea, in and of itself, can be true or false. Like Aristotle before them or Kant later, they regard a simple idea or concept as, strictly speaking, incapable of being either true or false.

"Truth and falsity," writes Locke, "belong . . . only to propositions"—to affirmations or denials which involve at least two ideas; or, as Kant says, "truth and error . . . are only to be found in a judgement," which explains why "the senses do not err, not because they always judge correctly, but because *they do not judge at all*."

Nevertheless, for Locke the clarity and distinctness of the ideas which enter into the formation of propositions enable the mind to judge intuitively and certainly of their truth. When ideas are clear and distinct, "the mind perceives the agreement or disagreement of two ideas immediately by themselves. . . . Such kind of truths the mind perceives at the first sight of the ideas together by bare intuition . . . and this kind of knowledge is the clearest and most certain that human frailty is capable of."

THE PROBLEM OF the criterion of truth is sometimes closely connected with the problem of the causes of error. Descartes seems to pass by natural steps from one to the other. Having decided that "the things which we conceive very clearly and distinctly are all true," he reminds

himself that there may be "some difficulty in ascertaining which are those that we distinctly conceive." The mystery of error looms large for Descartes because it seems to him that the human intellect, being created by God, must have a kind of natural infallibility, the infallibility of an instrument designed by God for knowing the truth, not for ignorance or error.

"If we did not know," Descartes reflects, "that all that is in us of reality and truth proceeds from a perfect and infinite being, however clear and distinct were our ideas, we should not have any reason to assure ourselves that they had the perfection of being true." But once we have "recognized that there is a God . . . and also recognized that all things depend upon Him, and that He is not a deceiver," we can infer that whatever we "perceive clearly and distinctly cannot fail to be true."

What, then, is the source of our errors? "I answer," writes Descartes, "that they depend on a combination of two causes, to wit, on the faculty of knowledge that rests in me, and on the power of choice or free will." Each perfect in its own sphere, neither the will nor the understanding by itself causes us to fall into error. "Since I understand nothing but by the power which God has given me for understanding, there is no doubt," Descartes declares, "that all that I understand, I understand as I ought, and it is not possible that I err in this."

The trouble lies in the relation of the will to the intellect. "Since the will is much wider in its range and compass than the understanding, I do not restrain it within the same bounds, but extend it also to things which I do not understand." It is not God's fault, says Descartes, if, in the exercise of my freedom, I do not "withhold my assent from certain things as to which He has not placed a clear and distinct knowledge in my understanding." But as long as "I so restrain my will within the limits of knowledge that it forms no judgment except on matters which are clearly and distinctly represented to it by the understanding, I can never be deceived."

There are other accounts of error, less elaborate than Descartes', which are similar to the extent that they place the cause in some combination of human faculties rather than in their simple and separate operation. Socrates explains to Theaetetus that false opinions arise when the

senses and the mind do not cooperate properly. Aristotle suggests that it is the imagination which frequently misleads the mind. Looking at the problem from the point of view of the theologian, Aquinas holds that Adam, in his state of innocence before the fall, could not be deceived. "While the soul remained subject to God," he writes, "the lower powers in man were subject to the higher, and were no impediment to their action." But man born in sin can be deceived, not because the intellect itself ever fails, but as a result of the wayward influence "of some lower power, such as the imagination or the like."

Lucretius, for whom sense, not mind, is infallible, attributes error to the fault of reason, which misinterprets the veridical impressions of the senses. "What surer test can we have than the senses," he asks, "whereby to note truth and falsehood?" He explains that the mind, not the senses, is responsible for illusions and hallucinations. "Do not then fasten upon the eyes this frailty of the mind."

Other writers, like Descartes, take the opposite view, that the senses are much less trustworthy than the intellect. Still others, like

Montaigne, seem to find that error and fallacy, rather than any sort of infallibility, are quite natural to all human faculties, and beset sense and reason alike. "Man," says Pascal, is "full of error, natural and ineffaceable, without grace. Nothing shows him the truth. Everything deceives him. Those two sources of truth, reason and the senses, besides being both wanting in sincerity, deceive each other in turn."

Considering the extremes to which men have gone in their appraisal of human prowess or frailty, Locke's moderate statement of the matter is worth pondering. "Notwithstanding the great noise made in the world about errors and opinions," he writes, "I must do mankind that right, as to say, there are not so many men in errors and wrong opinions as is commonly supposed. Not that I think they embrace the truth; but, indeed, because concerning these doctrines they keep such a stir about, they have no thought, no opinion at all. . . . And though one cannot say that there are fewer improbable or erroneous opinions in the world than there are, yet this is certain, there are fewer that actually assent to them, and mistake them for truths, than is imagined."

OUTLINE OF TOPICS

	PAGE
1. The nature of truth	924
1a. The signs or criteria of truth: methods of verification	
1b. The relation between truth and being or reality	925
1c. The relation of truth, goodness, and beauty	
2. The modes of truth and falsity	926
2a. The distinction between truth and falsity in the mind and in things: logical and ontological truth	
2b. The distinction between truth of statement and truth of signification: the distinction between real and verbal truth	
2c. The distinction between theoretical and practical truth: conformity to existence and conformity to right desire	
2d. The comparison of human and divine truth: finite truths and the infinite truth	
2e. The distinction between truth and probability: its relation to the distinction between knowledge and opinion	927
3. Truth and error in relation to human knowing and learning	
3a. Truth in the apprehensions of the sensitive faculty	
(1) The truth of sensations: judgments of perception	
(2) Truth in the memory and imagination	928

3*b*. Truth in the acts of the mind

(1) The truth of ideas: concepts and definitions

(2) The truth of propositions: the special problem of judgments about future contingencies

(3) Truth in reasoning: the truth of premises in relation to the truth of conclusions, logical validity and truth about reality

929

3*c*. The principle of contradiction as the foundation of truth in judgment and in reasoning3*d*. The nature and causes of error

(1) The infallibility of the senses and the mind: the respects in which they are incapable of error

(2) The nature and sources of error in human perception and thought: the distinction between error and ignorance

930

(3) Rules for the correction or prevention of error in thought

931

4. Comparison of the various disciplines with respect to truth

4*a*. Truth in science and religion: the truth of reason and the truth of faith4*b*. Truth in science and poetry: the truth of fact and the truth of fiction

932

4*c*. Truth in metaphysics, mathematics, and the empirical sciences: the truth of principles, hypotheses, and conclusions in the several speculative disciplines4*d*. Truth and probability in rhetoric and dialectic

5. The eternal verities and the mutability of truth

933

6. The accumulation or accretion of truth, and the correction of error, in the progress of human learning

7. The skeptical denial of truth

934

7*a*. The impossibility of knowing the truth: the restriction of all human judgments to degrees of probability; the denial of axioms and of the possibility of demonstration7*b*. The defense of truth against the skeptic

8. The moral and political aspect of truth

8*a*. Prevarication and perjury: the injustice of lying or bearing false witness8*b*. The expediency of the political lie

935

8*c*. Truth in relation to love and friendship: the pleasant and the unpleasant truth8*d*. Civil liberty as a condition for discovering the truth: freedom of thought and discussion

936

8*e*. The love of truth and the duty to seek it: the moral distinction between the sophist and the philosopher; martyrdom to the truth

REFERENCES

To find the passages cited, use the numbers in heavy type which are the volume and page numbers of the passages referred to. For example, in 4 HOMER *Iliad*, BK II [265 283] 12d, the number 4 is the number of the volume in the set, the number 12d indicates that the passage is in section d of page 12.

PAGE SECTIONS. When the text is printed in one column, the letters a and b refer to the upper and lower halves of the page. For example, in 53 JAMES *Psychology*, 116a 119b, the passage begins in the upper half of page 116 and ends in the lower half of page 119. When the text is printed in two columns, the letters a and b refer to the upper and lower halves of the left-hand side of the page, the letters c and d to the upper and lower halves of the right-hand side of the page. For example, in 7 PLATO *Symposium*, 163b 164e, the passage begins in the lower half of the left-hand side of page 163 and ends in the upper half of the right-hand side of page 164.

AUTHOR'S DIVISIONS. One or more of the main divisions of a work (such as PART, BK, CH, SECT) are sometimes included in the reference, line numbers, in brackets, are given in certain cases, e.g., *Iliad*, BK II [265 283] 12d.

BIBLICAL REFERENCES. The references are to book, chapter and verse. When the King James and Douay versions differ in title of books or in the numbering of chapters or verses, the King James version is cited first and the Douay, indicated by a (D), follows, e.g., OLD TESTAMENT *Vehemuh*, 7 45—(D) *Il Ludius*, 7 46.

SYMBOLS. The abbreviation "esp" calls the reader's attention to one or more especially relevant parts of a whole reference, "passim" signifies that the topic is discussed intermittently rather than continuously in the work or passage cited.

For additional information concerning the style of the references, see the Explanation of Reference Style, for general guidance in the use of *The Great Ideas*, consult the Preface.
